CONFERENCE OF EUROPEAN STATISTICIANS

Fifty-fourth plenary session Paris, 13-15 June 2006 Item 8 of the provisional agenda

SEMINAR ON HUMAN RESOURCES AND TRAINING SESSION III

The role of international organizations in statistics training for member country officials¹

Submitted by International Monetary Fund (IMF)

I. ABSTRACT

1. This paper covers the findings of a survey, carried out by IMF staff, of select international organizations on issues in statistical training of member country officials. Broadly, the findings show that most of the international organizations that responded operate on small training budgets and have either no, or only small, access to external funding. English is, by far, the dominant training language, and computer training plays a part in overall statistical training. Organizations rank courses/seminars/conferences (as a group) as the most important aspect of their training programs. The scope and number of external training programs grew fairly rapidly during 2000–05, covering a broad range of countries, sometimes with regional emphasis. Europe and, in particular, countries in Central and Eastern Europe and in the Commonwealth of Independent States (e.g., Belarus, Moldova, Russia, and Ukraine) have had sizable participation in the IMF courses in statistics. Organizations have not yet taken full advantage of the Internet's potential for training.

-

¹ This paper has been prepared at the invitation of the secretariat.

Demand for training is generated mainly by new mandates and working projects, as well as by countries' needs for training/technical assistance.

II. INTRODUCTION

- 2. This paper covers findings on statistical training of a number of international organizations surveyed recently by the IMF.² The information from this exercise has been combined with internal training data from the IMF to highlight some issues in statistical training and how European countries and institutions have benefited from the programs.
- 3. Broadly, the findings suggest that most international organizations operate on small training budgets. English is, by far, the dominant training language, and computer training plays a part in overall statistical training. Organizations rank courses/seminars/conferences (as a group) as the most important aspect of their training programs. This aspect covers external training targeted mostly at member country officials.
- 4. The scope and number of external training programs grew fairly rapidly during 2000 to 2005, covering a broad range of countries, sometimes with regional emphasis. Europe has been a major beneficiary from training in statistics, particularly at the IMF—judging by the steady increase in the number of officials who have participated in the courses.
- 5. The emerging issues in external training entail mainly better coordination in providing training and technical assistance to countries—that is, avoiding duplication of efforts while enhancing the complementarities of support to the countries. In addition, organizations have not yet taken full advantage of the Internet's potential for training. Further, means must be found to address the demand for training, generated mainly by countries' needs for training/technical assistance and by new mandates and working projects in the organizations. To address the demand for training, corrective measures need to be pursued both at the international and regional levels and would benefit also from the availability of training manuals and other materials in other languages.
- 6. The remainder of the paper is organized as follows. Chapter II covers the broad characteristics of training programs at various organizations. Chapter III covers the external training programs, and Chapter IV summarizes the training offered by the IMF to European officials. Chapter V provides the major conclusions of the paper; Chapter VI presents some issues for discussion. Appendix I lists the IMF's external training courses in statistics during 2003 to 2006, including at the IMF and other regional training centers.

III. GENERAL CHARACTERISTICS OF STATISTICAL TRAINING PROGRAMS

7. The majority of responding organizations specialize in macroeconomic statistics, while the rest focus on socio-demographic statistics and, to some extent, environmental statistics (Table 1). These areas of specialization are not necessarily exclusive; several organizations cover a broad range of statistical activities. However, details on further breakdown of the organizations' statistical

specialization within the specific groups are not available. These details, including the titles and content of specific training courses, could prove useful for sharing training materials among international organizations and avoiding duplicative training efforts.

- 8. The size of external resources currently available for training in statistics in international organizations ranges from a few thousand U.S. dollars to US\$3 million. The limited access to resources implies that, barring a major change, proposed reforms in this area should not entail large expenditures. Such reforms should focus on organizational changes, which could have a significant impact on realizing the desired outcome.
- 9. English is the dominant training language. It is followed somewhat closely by Spanish and French in that order. Portuguese is a distant fourth, while four other languages of instruction, namely, Arabic, Chinese, Italian, and Russian, were mentioned.⁴
- 10. An important aspect of statistical training is the computer courses in programs. Comments from various organizations indicate that this feature is important because of the need to familiarize the trainees with software packages, which form an integral part of data compilation and dissemination.
- 11. The questionnaire solicited the views of participating organizations on their ranking of importance of type of training program. Most organizations ranked courses/seminars/ conferences (as a group) number one. This validated the subsequent details requested in the rest of the questionnaire about this type of training program, as discussed in some detail below. Coming in a somewhat close second was outside training, entailing collaboration with universities and consulting firms. This was followed by others, including distance learning. Although the questionnaire did not pursue details of these other modes of training, some potential may exist for investigating further the use of distance learning in conjunction with better utilization of the Internet for overall training activities (see more details below).

¹⁷ The totals may not add across rows because some categories do not apply to (or there were no responses from) some organizations.

² Some organizations reported using more than one language.

3/Computer training, mostly in software packages, as part of an overall statistical training program.

Mostly with universities and, in some cases, consulting firms.
 Internal mobility of staff within organizations.
 Among the activities mentioned were country visits and distance/website training.

IV. THE EXTERNAL TRAINING PROGRAMS

12. Data coverage for the external training programs is quite good, indicating that the international organizations provide a sizeable number of training events (e.g., courses, seminars) that have reached an increasingly growing number of member country officials.⁵

A. Specifics of the Training Programs

- 13. During 2000–05, the scope and number of external training programs grew substantially (Table 2). Training events almost doubled, while the number of people benefiting from training increased twofold. The dominant training activity appears to have been the structured courses, which had the most events over the period and tended to last the longest; thus, these courses may have had the greatest impact on the targeted audience. Seminars were the next most active form of training in terms of events but, on the whole, had a shorter duration in terms of number of days covered. As some respondents pointed out, conferences and symposiums, although used sparingly, can and tend to reach out to larger audiences, mainly comprising senior policymakers. They also tend to be short—not exceeding one day.
- 14. Organizations have extended the outreach of external training programs, as evidenced by the number of regions and countries covered. The average number of countries covered by training per participating organization grew by about 20 percent between 2000 and 2005, but this figure does not fully reflect the actual expansion in country coverage. Allowing for the fact that the number of organizations that undertook training in countries increased from 6 in 2000 to 10 during 2004–05, the total number of countries covered (some with multiple training programs) increased rather substantially.
- 15. The European region received a sizable amount of training—reflected by the average number of countries covered per year during 2002–03 and the slight increase in such country coverage during 2004–05. Nevertheless, Europe's participative share in training declined over the period. The overall growth benefited mostly developing and emerging countries in Africa and South and Central America. This growth was reflected in the total number of countries covered and the number of participating international organizations.
- 16. Participation in training programs was mostly by invitation, allowing the sponsoring organizations to target groups of officials already known to them. Admission by competitive application was an alternative mode, which evidently has been expanded since 2004. The objective of training was mostly to upgrade specific skills or build capacity, consistent with the selective access procedures. To a lesser extent, organizations also sought to provide general training—virtually all the conferences and symposia were geared to this endeavor.

^{1/} Calendar year.
^{2/} Figures may underestimate totals, given that some organizations provided data through July 2005 rather than estimates for the whole year.

^{3/} Average numbers of countries per participating training organization. Regional data may not add up to total because of differences in regional training emphasis of the organizations.

As Some of the responding organizations provide only internal training. Totals may not add for each group because of 'not stated' categories.

17. Essentially, all reporting organizations indicated some form of ex post evaluation of training programs. The preferred mode was on-site evaluation, but follow-up surveys have been quite important in some cases, complementing the on-site evaluation. This may indicate that feedback is an important feature for designing and implementing training activities.

B. Access to Training Materials

18. The distribution of training materials could be improved; only some reporting organizations have placed the materials on either the internal or external websites (Table 3). Several organizations still use only pamphlets and visual aids for distributing training materials. Very few reporting organizations indicated they have consolidated libraries or depositories for training materials, and only a few indicated they share their training materials with other international organizations.

C. Demand for Training

- 19. The organizations report that the demand for training is partly driven by the needs of member countries for training their officials. However, the main demand is reported to emanate from new work projects and changing mandates of the organizations. The new work projects are linked to internal efforts to adapt to changing circumstances, whereas the changing mandates reflect external forces that are internalized when member countries redefine the organizations' missions. The two factors may indeed be interlinked because new mandates are likely to lead to new work projects. Moreover, they are both, in turn, partly related to emerging forces unleashed by globalization and the information revolution, which have contributed to the substantial growth in the speed of access and requirements for information.
- 20. Organizations assess the demand for training mainly via surveys but also through focus groups and other sources—mostly human resource groups—as well as the number of course applications. More than 60 percent of respondents reported their organizations were not able to meet the training demand, and an even larger percentage (about 80 percent) of the group of organizations reported budgetary concerns as a major constraint to training.
- 21. Views on the nature of the training gap (the excess demand for training) vary across the organizations (Table 4). The responses were quite limited. On the whole, they appear to suggest that the gap ranges from small to medium and has a small-to-medium impact on the organizations' missions but a medium impact on the organizations' statistical missions.
- 22. Organizations, however, appear somewhat tentative or skeptical about the effect of internal/external efforts or the need for international cooperation in addressing the training gap.

Pamphlets and visual aids.
 Related to limited national capacity and demand for technical assistance.
 Including Human Resources Department, an interagency task force, and the number of course applications.

¹The gap is measured in terms of excess demand for training.

V. IMF STATISTICAL TRAINING IN EUROPE

- 23. The IMF targets statistical training to European officials largely through (1) the IMF Institute courses, offered at both the IMF headquarters and the Joint Vienna Institute (JVI), and (2) the Statistics Department's outreach courses conducted in European countries, usually in collaboration with a local/regional training organization. During 2000–2005, a steadily growing number of officials—a total of 561 (Table 5)—have benefited from the training efforts under (1) above. Country and regional organizations (e.g., the Bank for International Settlements and the European Central Bank) have participated in the offered courses. The countries receiving the lion's share of training were mainly those in Central and Eastern Europe and in the Commonwealth of Independent States (e.g., Belarus, Moldova, Russia, and Ukraine), reflecting the JVI's mandate to train officials from the transition countries of Europe and Asia.
- 24. During 2003–06, the Statistics Department offered four courses per year at the JVI, covering a broad range of macroeconomic statistics. The most popular courses were in monetary and financial statistics and financial soundness indicators (FSIs, Table 6). The Statistics Department witnessed a rapid growth in its outreach program in 2004–06 (through January 2006), compared with the period 2002–03, and again the most popular courses covered monetary and financial statistics (Table 7). The recent surge in courses in monetary and financial statistics is related to three initiatives, namely: (1) the preparation of the compilation guide for monetary statistics; (2) the efforts to introduce standardized reporting forms; and (3) the outreach FSI program. The training efforts entailed with these initiatives is now winding down or has been completed, and future such training in Europe and elsewhere will be limited.

VI. CONCLUSIONS

- 25. The major issues emerging from the analysis of partial information available on training is that international organizations operate on rather limited training budgets. Over time, an aggressive campaign to mobilize the desirable resources for training likely will yield benefits. In the meantime, concurrent efforts must be made to maximize the effectiveness of available resources. The rather limited use of the Internet and the limited sharing of information and training materials are obvious areas that need to be addressed.
- 26. Organizations might also consider a number of suggestions by respondents to the survey. These include: (1) promoting regional training centers (proximity to clients and common language facilitate greater outreach); (2) involving national statistical offices' experts in training sessions as trainers (they could then turn around and train local staff); (3) recognizing that some programs will yield results in the long run and that one-shot exercises may not solve the problem (thus, planning and implementation horizons should also focus on the medium-to-long run); and (4) developing joint e-learning facilities for international statisticians.
- 27. With regard to the IMF, it has not been meeting the overall training demand mainly because of resource constraints. As a result, the growth in its training program has catered mostly to developing

ECE/CES/2006/31 page 10

countries, although training in Europe has covered an increasing number of country officials, mainly those in transition countries. However, the adequacy (in terms of topics and countries covered and delivery mechanism) of the training program to European countries (indeed elsewhere) can best be judged by the recipient countries; such feedback is also critical in identifying areas of improvement.

VII. ISSUES FOR DISCUSSION

- 28. Do CES members feel that international organizations provide adequate training in statistics for country officials in general and, in particular, in Europe?
- 29. Is the training appropriate in terms of (1) overall quality; (2) frequency; (3) coverage of topics; and (4) coverage of countries? How could training be improved?
- 30. Do CES members feel that there is adequate coordination among international organizations in providing training for member country officials?

Source: IMF Institute (INSAV), PATS System.

Run Date: March 1, 2006.

Program (CT), IMF Institute, Washington D.C. (HQ), Internal Economics Training Program-IMF, Washington D.C. (IT), Joint Africa Institute (JA), ¹List of courses is preliminary. CY 2005 courses will be finalized in May 2006; CY 2006 courses in May 2007.

² Abbreviations refer to the following course types: Joint Regional Training Center for Latin America, Brasilia (BT), Joint China-IMF Training Joint Vienna Institute (JV), IMF-AMF Regional Training Program (RT), and IMF-Singapore Regional Training Institute (ST).

^{3/} IT 05.304, IT 05.305, and IT 05.314 were taught through the Internal Economics Training Program for IMF staff; all other courses were for external participants.

* * * * *

Details of the survey questionnaire are available upon request.
 Technical assistance usually requires a certain amount of training to enhance its effectiveness.

⁴ The scope for these other languages may be significant, given the regional focus of some external training programs. Some comments highlighted that availability of training manuals, including their translation in to other languages, could be a significant way forward in several outreach training programs. Scope may exist to expand training in other languages, resources permitting.

⁵ Since this paper focuses on external training, data for, and other information on, internal training are not covered in detail.
