Abstract

GSBPM provides a standard framework and harmonised terminology to help statistical organisations to modernise their statistical production processes. GSIM is a reference framework for statistical information that provides a set of standardised, consistently described information objects. Conceptually, the two models are closely related and complementary as GSIM describes information objects used as input/output in statistical production process. As usage of both models is growing, it is important to provide clearer view on how these two models can be used together in a harmonious way.

A task team consisting of GSBPM and GSIM experts was created under the Supporting Standards Group in 2019. During 2020 the task team has continued mapping GSBPM sub-processes to GSIM information objects and test-driving both models with a variety of use cases. This activity is providing an integrated view on how GSBPM and GSIM can work together, which is further advancing the standardisation of statistical production. We discuss here the work completed so far and propose some ideas for the next steps.

Keywords

GSIM, GSBPM

Model (please specify name of at least one of models (i.e. GSBPM, GSIM, GAMSO and CSPA) that your abstract is related to)
