

Notes to Forest Products Statistics

As of July 2019

General

Symbols

E = Secretariat estimate

R = data repeated from previous years (owing to changing exchange rates, value figures may not be the same)

N = National estimate based upon non-official data

Note that product and regional aggregates are calculated from subitems and do not have a symbol.

A "0" (zero) indicates less than 1/2 of the unit.

Consumption is production (or removals) plus imports minus exports to give a result of apparent consumption. Consumption figures for subregions are calculated by summing the subregion's production and trade – they may thus not coincide with the sum of consumption of the listed countries as some of these may not have consumption figures.

Country

Austria: Trade data for item 4 (recovered wood) for 2017-2018 are included under item 3.2.

Canada: Trade by species of coniferous sawnwood (item 6.C, Fir/Spruce and Pine) does not include mixed shipments which comprise majority of trade.

Canada and United States: Sawn softwood (item 6.C) trade (and Canadian production) are estimated by secretariat, converting nominal cubic meters to actual cubic meters by multiplying with 0.72 factor (since 2002).

Finland: Item 11 (recovered paper) is paper consumed by the pulp industry, i.e. does not include paper used for any other purpose. Recovered wood production (item 4) is only that which is burnt.

France: Trade of residues (item 3.2) includes recovered post-consumer wood (item 4).

Germany: Roundwood removals have been revised compared to data provided in previous years.

Netherlands: Prior to 2016 only stemwood counted in removals.

Norway: Recovered paper production (item 11) prior to 2016 was consumption by paper industry. Now it is amount collected.

Poland: Item 4 (recovered wood) covers only wood used in producing particle boards.

Portugal: For 2016 (and earlier) wood residues production (item 3.2) covers only wood for energy.

United States: Plywood (item 8.1) includes LVL since 2014.
