

INLAND TRANSPORT COMMITTEE

Working Party on the Transport of Dangerous Goods

Joint Meeting of the RID Committee of Experts and the
Working Party on the Transport of Dangerous Goods

Geneva, 22-26 March 2009

**OUTSTANDING ISSUES OR PROPOSALS OF AMENDMENTS TO THE RECOMMENDATIONS
ON THE TRANSPORT OF DANGEROUS GOODS**

Environmentally hazardous substances

Note by the secretariat

1. Reference is made to ST/SG/AC.10/C.3/2004/109. The secretariat has prepared a list of all substances of the UN Model Regulations Dangerous Goods List which are identified in the IMDG Code as marine pollutants or severe marine pollutants, and checked the data available on these substances to see whether they meet the GHS criteria for classification as aquatic pollutants according to 2.9.3 of the Model Regulations (see annex).
2. Two sources of data have been used: the GESAMP/EHS Composite List of Hazard Profiles (2003) (IMO document BLG/Circ. 13 of 16 May 2003) and the N-CLASS database.
3. The data have been consolidated in a table as follows:

- | | |
|-------------|---|
| Column (1): | UN number |
| Column (2): | Proper shipping name (English) |
| Column (3): | Proper shipping name (French) |
| Column (4): | Identification as marine pollutant in the IMDG Code |
| Column (5): | GESAMP Hazard Profile List, Column A (Bioaccumulation and training) |
| Column (6): | GESAMP Hazard Profile List, Column B (Damage to living resources) |
| Column (7): | Classification as aquatic pollutant according to the N-CLASS database and Council Directive 67/548/EEC, as amended (EU) |
| Column (8): | Comments |
| Column (9): | Assessment by the secretariat whether the data provided by these two sources can lead to the conclusion that the criteria of 2.9.3 are met. |

Methodology

4. Marine pollutants in the IMDG Code are identified on the basis of data provided by GESAMP/EHS i.e. when hazard rating 4 or 5 has been assigned to the substance in column B (column (6) in this document), or hazard rating “+”, “Z” or “T” in column A (column (5) in this document).

5. Hazard rating 4 or 5 in column B implies that the 96 h LC₅₀ to aquatic organisms is ≤ 1 mg/l, and therefore the substance meets the criteria of 2.9.3.
6. Hazard rating T in column A means that the substance is liable to produce tainting of seafood. This criterion is not used in the GHS and therefore is not relevant for this assessment.
7. Hazard rating “+” or “Z” in column A indicates that the substance is bioaccumulated, but these ratings are useful for the purposes of classification according to 2.9.3 only when the substance has a 96 h LC₅₀ comprised between 1 and 10 mg/l, which is indicated by the hazard rating 3 in column B.
8. Hazard ratings 2, 1 or 0 in column B implies that the 96 h LC₅₀ of the substance is more than 10 mg/l and therefore does not meet the criteria of 2.9.3.
9. Therefore, apart from those referred to in para. 5 above, only substances assigned hazard rating 3 in column B may meet the criteria of 2.9.3, depending on their biodegradability and bioaccumulation properties (unless other data are available).
10. Hazard ratings “Z” and “+” do not give indication about biodegradability, and therefore are not always sufficient to reach a conclusion according to 2.9.3. They are described as follows in GESAMP report and studies No. 35:
 - “+” Refers to a substance which is known to be accumulated to a significant extent by certain marine organisms, which is not readily excreted or degraded into a less harmful metabolite by the organism and which as a consequence is known, or strongly suspected to be harmful to the animal, or to man if he eats the organism. Examples are mercury compounds and DDT.

Note 1: No precise definition of the words “significant extent” has been adopted but it is generally agreed that a material which is bioaccumulated to the extent of one hundredfold would be a candidate for this rating. Similarly where the log of the octanol: water partition coefficient ($\log P_{ow}$) exceeds three the substance would be a candidate for inclusion. Final inclusion is dependent on the assessment of likely harm.

Note 2: Substance which are known to be converted to other substances which by themselves will fall within this definition are included in this group.
 - “Z” Refers to a substance which is known or strongly suspected to be accumulated by marine organisms but which is rapidly lost (biological half-life of about 1 week or less) by that organism when it moves or is moved from the zone of exposure. Substances are only given this rating when they are also known or strongly suspected to be harmful to the organisms or man.
11. From these descriptions, it can be concluded that substances assigned hazard ratings “T, 3” or “Z, 3” are not very likely to meet the criteria unless they are not rapidly degradable. Those assigned hazard rating “+, 3” are likely to meet the criteria, but since the $\log P_{ow}$ and BCF cut-off limits ($\log P_{ow} > 3$ and BCF > 100) are different from those of the GHS ($\log P_{ow} \geq 4$ and BCF ≥ 500), some of them may not meet the criteria (unless they are not rapidly degradable).

12. In order to determine whether the above critical cases met the GHS criteria, the secretariat has checked the data available from the N-CLASS database for all marine pollutants.
13. The indications R50, R50 R53 and R51 R53 used in the EU classification system have the following meaning:

R50	96 hr LC50 (for fish) $\leq 1 \text{ mg/l}$ or 48 hr EC50 (for Daphnia) $\leq 1 \text{ mg/l}$ or 72 hr IC50 (for algae) $\leq 1 \text{ mg/l}$
R50 R53	96 hr LC50 (for fish) $\leq 1 \text{ mg/l}$ or 48 hr EC50 (for Daphnia) $\leq 1 \text{ mg/l}$ or 72 hr IC50 (for algae) $\leq 1 \text{ mg/l}$ and the substance is not readily degradable and/or the Log Pow ≥ 3 (unless the experimentally determined BCF <100)
R51 R53	96 hr LC50 (for fish) $1 \text{ mg/l} < \text{LC50} \leq 10 \text{ mg/l}$ or 48 hr EC50 (for Daphnia) $1 \text{ mg/l} < \text{EC50} \leq 10 \text{ mg/l}$ or 72 hr IC50 (for algae) $1 \text{ mg/l} < \text{IC50} \leq 10 \text{ mg/l}$ and the substance is not readily degradable and/or the Log Pow ≥ 3 (unless the experimentally determined BCF <100)

Notes

- *The differences between the GHS criteria and the N-class criteria are printed in bold.*
- *Daphnia is the model organism for crustacea, therefore the 48 hr EC50 values of the N-Class and of the GHS are comparable.*
- *Algae is the model organism for aquatic plants, therefore the 72 hr IC50 values of the N-Class and of the GHS are comparable.*
- *The abbreviations (Log) Pow and (Log) Kow have exactly the same meaning.*

In the case of R50 and R50 R53, the toxicity is equal to or below 1 mg/l, therefore the substances to which they have been assigned meet the criteria of section 2.1.3.

In the case of R51 R53, the criteria are met if the substance is not readily degradable. Otherwise the values of Log Pow and BCF had to be checked.

14. A “YES” in column (9) means that according to the GESAMP and/or the EU data, the criteria of 2.9.3 are met, and the special provision suggested in ST/SG/AC.10/C.3/2004/109 could be applied.
15. A “NO” in column (9) means that the data provided by GESAMP or the N-CLASS database were not sufficient to conclude that the substance met the criteria, and therefore the special provision suggested in ST/SG/AC.10/C.3/2004/109 would not be appropriate at this time.

UN No	Name and description	Nom et description	Column (4) of IMDG DGL Subsidiary risk (P or PP)	GESAMP hazard profile		Aquatic classification (NClass database)	Comments	Aquatic pollutant special provision
