Proposal for amendments to Regulation No. 110 (CNG and LNG vehicles)

Submitted by the expert from the International Organization for Standardization

The text reproduced below was prepared by the expert from the International Organization for Standardization (ISO) to harmonize the requirements on Compressed Natural Gas (CNG) and/or Liquefied Natural Gas (LNG) vehicles of UN Regulation No. 110 with those of the international standard ISO 11439:2013 (see report ECE/TRANS/WP.29/GRSG/91, para. 28). It is based on official document ECE/TRANS/WP.29/GRSG/2017/31 distributed at the 113th session of the Working Party on General Safety Provisions (GRSG). The modifications to the current text of UN Regulation No. 110 are marked in bold characters for new and strikethrough for deleted characters.

I. Proposal

*Table of contents, Annexe 3A, remove the entry for Appendix H*

*Paragraph 2. (References), amend to read:

"2. References

The following standards contain provisions that, through reference in this text, constitute provisions of this Regulation.

ASTM Standards*

- ASTM B117-90  Test method of Salt Spray (Fog) Testing
- ASTM B154-92  Mercurous Nitrate Test for Copper and Copper Alloys
- ASTM D522-92  Mandrel Bend Test of attached Organic Coatings
- ASTM D1308-87  Effect of Household Chemicals on Clear and Pigmented Organic Finishes
- ASTM D2344-84  Test Method for Apparent interlaminar Shear Strength of Parallel Fibre Composites by Short Beam Method
- ASTM D3170-87  Chipping Resistance of Coatings

Insert new paragraphs 24.15. to 24.21., to read:

"24.15. As from the official date of entry into force of the 03 series of amendments, no Contracting Party applying this UN Regulation shall refuse to grant or refuse to accept UN type-approvals under this UN Regulation as amended by the 03 series of amendments.

24.16. As from 1 September 2019, Contracting Parties applying this UN Regulation shall not be obliged to accept UN type-approvals of components approved to the requirements of Part I of this Regulation to the 02 series of amendments, first issued after 1 September 2019.

24.17. As from 1 September 2021, Contracting Parties applying this UN Regulation shall not be obliged to accept UN type-approvals of vehicles approved to the requirements of Part II of this regulation to the 02 series of amendments, first issued after 1 September 2021.

24.18. Contracting Parties applying this UN Regulation shall continue to accept UN type-approvals issued according to the 02 series of amendments to the UN Regulation first issued

- before 1 September 2019 in the case of components approved to the requirements of Part I of this Regulation, and
- before 1 September 2021 in the case of vehicles approved to the requirements of Part II of this regulation.

24.19. Contracting Parties applying this UN Regulation shall not refuse to grant UN type-approvals according to any preceding series of amendments to this UN Regulation or extensions thereof.

24.20. Contracting Parties applying the UN Regulation shall continue to accept UN type-approvals of, and to grant extensions of approvals to the equipment and part to the preceding series of amendments to the UN

Regulation which are not affected by the changes introduced by the 03 series of amendments.

**24.21.** Contracting Parties applying this UN Regulation shall continue to accept UN type-approvals to the 02 series of amendments to the UN Regulation, first issued before 1 September 2021.

**Annex 3A**

**Paragraph 6.3.6., amend to read:**

"6.3.6. Plastic liners

The tensile yield strength and ultimate elongation shall be determined in accordance with paragraph A.22. (Appendix A to this annex). Tests shall demonstrate the ductile properties of the plastic liner material at temperatures of -50 °C or lower by meeting the values specified by the manufacturer; the polymeric material shall be compatible with the service conditions specified in paragraph 4. of this annex. In accordance with the method described in paragraph A.23. (Appendix A to this annex), the softening temperature shall be at least 90 °C, and the melting temperature at least 100 °C."

**Paragraph 6.12., amend to read:**

"6.12. Exterior environmental protection

The exterior of cylinders shall meet the requirements of the environmental test conditions of paragraph A.14. (Appendix A to this annex). Exterior protection may be provided by using any of the following:

(a) A surface finish giving adequate protection (e.g. metal sprayed on aluminium, anodizing); or

(b) The use of a suitable fibre and matrix material (e.g. carbon fibre in resin); or

(c) A protective coating (e.g. organic coating, paint) that shall meet the requirements of paragraph A.9. (Appendix A to this annex).

Any coatings applied to cylinders shall be such that the application process does not adversely affect the mechanical properties of the cylinder. The coating shall be designed to facilitate subsequent in service inspection and the manufacturer shall provide guidance on coating treatment during such inspection to ensure the continued integrity of the cylinder.

Manufacturers are advised that an environmental performance test that evaluates the suitability of coating systems is provided in the informative Appendix H to this annex."

**Paragraph 8.6.4., amend to read:**

"8.6.4. Acid Environment test

One cylinder shall be tested in accordance with paragraph A.14. (Appendix A to this annex) and meet the requirements therein. An optional environmental test is included in the informative Appendix H to this annex."

**Annex 3A, Appendix A**

**Paragraph A.14., amend to read** (inserting new sub-paragraphs A.14.1. to A14.6., based mainly on the text of Annex 3A, Appendix H):
A.14. Acid Environmental test

On a finished cylinder the following test procedure should be applied:

(a) Exposing a 150 mm diameter area on the cylinder surface for 100 hours to a 30 per cent sulfuric acid solution (battery acid with a specific gravity of 1.219) while the cylinder is held at 26 MPa;

(b) The cylinder shall then be burst in accordance with the procedure defined in paragraph A.12. above and provide a burst pressure that exceeds 85 per cent of the minimum design burst pressure.

A.14.1. Scope

This test is applicable to type CNG-2, CNG-3 and CNG-4 designs only.

A.14.2. Cylinder set-up and preparation

The upper section of the cylinder will be divided into 5 distinct areas and marked for preconditioning and fluid exposure (see Figure A.1). The areas will be nominally 100 mm in diameter. The areas shall not overlap on the cylinder surface. While convenient for testing, the areas need not be oriented along a single line, but shall not overlap the immersed section of the cylinder.

Although preconditioning and fluid exposure is performed on the cylindrical section of the cylinder, all of the cylinder, including the domed sections, should be as resistant to the exposure environments as are the exposed areas.

Figure A.1
Cylinder orientation and layout of exposure areas

A.14.3. Pendulum impact preconditioning

The impact body shall be of steel and have the shape of a pyramid with equilateral triangle faces and a square base, the summit and the edges being rounded to a radius of 3 mm. The centre of percussion of the pendulum shall coincide with the centre of gravity of the pyramid; its distance from the axis of rotation of the pendulum shall be 1 m. The total mass of the pendulum referred to its centre of percussion shall be 15 kg. The energy of the pendulum at the moment of impact shall be not less than 30 Nm and as close to that value as possible.

During pendulum impact, the cylinder shall be held in position by the end bosses or by the intended mounting brackets. The cylinder shall be un-pressurized during preconditioning.

A.14.4. Environmental fluids for exposure

Each marked area is to be exposed to one of five solutions for 30 minutes. The same environment shall be used for each location throughout the test. The solutions are:
Sulphuric acid: 19 per cent solution by volume in water;
Sodium hydroxide: 25 per cent solution by weight in water;
5% Methanol/95% gasoline: gasoline concentration of M5 fuel meeting
the requirements of ASTM D4814;
Ammonium nitrate: 28 per cent by weight in water;
Windshield washer fluid 50 per cent by volume solution of methyl
alcohol and water.

When exposed, the test sample will be oriented with the exposure area
uppermost. A pad of glass wool (approximately 0.5 mm thick and
between 90 and 100 mm in diameter) shall be placed on the exposure
area. Apply an amount of the test fluid to the glass wool sufficient to
ensure that the pad is wetted evenly across its surface and through its
thickness for the duration of the test, and that the concentration of the
fluid is not changed significantly during the duration of the test.

A.14.5. Pressure cycle and hold

The cylinder shall be hydraulically pressure cycled between not less
more than 2 MPa and not more less than 26 MPa for a total of 3,000
cycles. The maximum pressurization rate shall be 2.75 MPa per second.
After pressure cycling, the cylinder shall be pressurized to 26 MPa and
held at that pressure a minimum of 24 hours and until the elapsed
exposure time (pressure cycling and pressure hold) to the environmental
fluids equals 48 hours.

A.14.6. Acceptable results

The cylinder shall be hydraulically tested to destruction in accordance
with the procedure in paragraph A.12. The burst pressure of the
cylinder shall be not less than 80-85 per cent of the minimum design
burst pressure.

Replace through the whole text the references to acid environmental test and delete
the references to Annex 3A, Appendix H.

Paragraph A.16., amend to read:
"A.16. Penetration tests

A cylinder pressurised to 20 MPa ± 1 MPa with compressed gas shall be
penetrated by an armour piercing bullet with a diameter of 7.62 mm or
greater. The bullet shall completely penetrate at least one side wall of the
cylinder. For type CNG-1 designs, the projectile shall impact the side
wall at 90°. For type CNG-2, CNG-3 and CNG-4 designs, the projectile shall
impact the side wall at an approximate angle of 45°. The cylinder shall reveal
no evidence of fragmentation failure. Loss of small pieces of material, each
not weighing more than 45 grams, shall not constitute failure of the test. The
approximate size of entrance and exit openings and their locations shall be
recorded."

Paragraph A.22., amend to read:
"A.16. Tensile properties of plastics

The tensile yield strength and ultimate elongation of plastic liner material
shall be determined at -50 °C using ISO 527-2 3628, and meet the
requirements of paragraph 6.3.6. of Annex 3A."

Paragraph A.23., amend to read:
"A.23. Melting Softening temperature of plastics
Polymeric materials from finished liners shall be tested in accordance with the method described in ISO 306, and meet the requirements of paragraph 6.3.6. of Annex 3A. The softening temperature shall be at least 100°C."

Annex 3A, Appendix F, paragraph F.2.1., subparagraph (c), amend to read:
"(c) Fracture toughness of the finished cylinder or the liner from a finished cylinder, as determined at room temperature for aluminium and at -40 °C for steel, shall be established using a standardized testing technique (either ISO/DIS 12737 or ASTM 813-89 or BS 7448) in accordance with Sections 8.4 and 8.5 of BS PD6493"

Annex 3A, Appendix H, shall be deleted.

Annex 4F, paragraph 2.2., amend to read:
"2.2. CNG filling units designed in accordance with ISO 14469 -1 first edition 2004-11-01 or ISO 14469-2:2007 and meeting all the requirements therein are deemed to fulfill the requirements of paragraphs 3. and 4. of this annex."

Annex 4J, paragraph 3.1.5., amend to read:
"3.1.5. The LNG filling receptacle shall be made out of non-sparking material and should comply with the no igniting evaluation tests described in ISO 14469."

II. Justification

Furthermore, the following references shall be updated:
ISO 37 is now ISO 37: 2011
ISO 188 is now ISO 188 2011
ISO 306 is now ISO 306: 2004
ISO 527 Pt 1 is now ISO 527-2: 2012 (per the harmonization)
ISO 642 is ISO 642: 1999
ISO 12991 is repeated twice in the references, so this first one can be deleted.
ISO 1307 is now ISO 1307: 2006
ISO 1402 is now ISO 1402: 2009
ISO 1431 is now ISO 1431: 2009
ISO 1436 is now ISO 1436: 2009
ISO 1817 is now ISO 1817: 2015
ISO 2808 is now ISO 2808: 2007
ISO 3628 is deleted per harmonization
ISO 4080 is now ISO 4080: 2009
ISO 4624 is now ISO 4624: 2016
ISO 7225 is now ISO 7225: 2005
ISO/DIS 7866 is now ISO 7866: 2012
ISO 9001 is now ISO 9001: 2015
ISO/DIS 9809 is now ISO 9809-1: 2010 “Gas cylinders — Refillable seamless steel gas cylinders — Design, construction and testing — Part 1: Quenched and tempered steel cylinders with tensile strength less than 1 100 MPa”
ISO/DIS 12737 has been withdrawn by ISO, thus I would delete reference to this standard (in Annex 3A, Appendix F) as follows:

Change (c) as follows: “……testing technique (either ISO/DIS 12737 or ASTM 813-89 or BS 7448)…”
ISO 12991 is now ISO 12991: 2012
ISO 14469-1 and ISO 14469-2 have been replaced/consolidated into one standard: ISO 14469: 2017 “Road vehicles -- Compressed natural gas (CNG) refuelling connector”. This consolidation means that references to ISO 14469-1 and ISO 14469-2 must be changed in the following 2 locations:

---

F.2. Leak-Before-Break (LBB)

F.2.1. Engineering critical assessment. This analysis may be carried out to establish that the finished cylinder will leak in the event of a defect in the cylinder or liner growing into a through-wall crack. A leak-before-break assessment shall be performed at the cylinder side wall. If the fatigue sensitive location is outside the side wall, a leak-before-break assessment shall also be performed at that location using a Level II approach as outlined in BS PD6493. The assessment shall include the following steps:

(a) Measure the maximum length (i.e. major axis) of the resultant through-wall surface crack (usually elliptical in shape) from the three cylinder cycle tested under the design qualification tests (according to paragraphs A.13. and A.14. of Appendix A to this annex) for each type of design. Use the longest crack length of the three cylinders in the analysis. Model a semi-elliptical through-wall crack with a major axis equal to twice the measured longest major axis and with a minor axis equal to 0.9 of wall thickness. The semi-elliptical crack shall be modelled at the locations specified in paragraph F.1. above. The crack shall be oriented such that the highest tensile principal stress shall drive the crack;

(b) Stress levels in the wall/liner at 26 MPa obtained from the stress analysis as outlined in paragraph 6.6. of Annex 3A shall be used for the assessment. Appropriate crack driving forces shall be calculated using either Section 9.2 or 9.3. of BS PD6493;

(c) Fracture toughness of the finished cylinder or the liner from a finished cylinder, as determined at room temperature for aluminium and at -40 °C for steel, shall be established using a standardized testing technique (either ISO/DIS 12737 or ASTM 813-89 or BS 7448) in accordance with Sections 8.4 and 8.5 of BS PD6493;

Change (c) as follows: “……testing technique (either ISO/DIS 12737 or ASTM 813-89 or BS 7448)…”

Also, in Annex 4J, change the reference in para 3.1.5 to ISO 14469-1:2004 to ISO 14469.

Replace ISO 15500 with ISO 15500-2:2016 “Road vehicles -- Compressed natural gas (CNG) fuel system components -- Part 2: Performance and general test methods”, and with ISO 15500-17:2012 “Road vehicles -- Compressed natural gas (CNG) fuel system components -- Part 17: Flexible fuel line”. Note that both these references (ISO 15500-2 and ISO 15500-17) are already specified in the ECE R110, while ISO 15500 is not.

ISO 21028-1 is now ISO 21028-1: 2016
ISO 21029 is now ISO 21029-1: 2015

ISO/IEC Guide 48 – 1986 does not exist – it has been withdrawn by ISO. However, ISO/IEC 48 is not referenced anywhere in ECE R110. Therefore delete.

ISO 11439 is now ISO 11439: 2013
