

Austrian Statistical Datawarehouse – an application of the GSIM model

Eliane Schwerer (Statistics Austria, Austria)

email

Abstract

In the past there existed no central repository to collect and distribute metadata as well as data at Statistics Austria. One of the intensively discussed organizational issues through the last years was the desire to provide an easy accessible and centralized platform. Therefore a Statistical Data Warehouse ("sDWH") has been developed and during the spring of 2017 established as a house-wide system. The sDWH is a direct application of the structures and concepts parts of the GSIM model. The presentation will introduce the application developed by Statistics Austria and will point out the advantages of this structured data storage.
