### ***Abstract***

Statistics Finland has been using GSBPM very actively in describing to-be states in projects where new business architecture (processes) has been created. Utilizing one common framework coherently for several traditionally very different silo-based statistical processes can be, in practice, challenging and time consuming. Following GSBPM Finland has been trying to create a method where all possible functions included in different phases of GSBPM would be identified as services. Projects implementing GSBPM could thereafter select the services needed and build their information system based on those services.

Following, Finland is suggesting a facilitated exercise where services needed in different phases of GSBPM could be identified and described (as CSPA services). Including also those services (phases) in GSBPM, where no digitalization is possible.
