Abstract

Statistics Sweden is currently in the process of implementing metadata-driven statistical production. This is done by expanding the use of GSBPM and GSIM.

The focus right now is to improve two capabilities; Metadata Management and Use Metadata in Production. Together, the two capabilities will form a platform with available metadata for designing process steps and then use the designed metadata actively throughout the production.

The responsibility for Metadata management is to coordinate and maintain metadata, in order to get higher quality and better comparability for users. Use Metadata in Production will link metadata with a statistical program, in a specific time to a data structure.

This presentation will describe SCB:s ambitions to implement metadata driven production in a structured way.
