Presentation

Abstract

In Statistics Finland, as in other NSO's, the business environment is changing. New kind of data sources and the need to create integrated data ware houses are challenging the traditional way of producing statistics. This requires changes into the production process and especially data- and metadata management. The Presentation discusses Statistics Finland's development work around these issues. Currently, we are focusing on GSBPM phases 1-5. As a general principle, we try to utilize international standards in this development work as much as possible.
