Where do we want to go?

1. Environmental transparency and accountability
2. Better integrated information for understanding relationships between people and the environment
3. Improved local level information (geospatial analysis)
4. Identify technologies and markets for environmental goods, services and financing
5. Promote citizen participation and bottom up action
Example: UN Biodiversity Lab
Example: Global surface water

The Aral Sea has declined by around 80% since 1985.
