Working Party on Customs Questions affecting Transport

Group of Experts on Conceptual and Technical Aspects of Computerization of the TIR Procedure

Third session

Geneva, 13–15 September 2021 Item 4 (d) of the provisional agenda eTIR conceptual, functional and technical documentation version 4.3: eTIR technical specifications

Technical glossary, analysis on capacity, error codes, XSD files, code lists and mitigation measures of the eTIR system

Revision

Note by the secretariat

I. Mandate

The Inland Transport Committee (ITC), at its eighty-second session (23-28 February 2020) approved (ECE/TRANS/294, para. 841) the establishment of the Group of Experts on Conceptual and Technical Aspects of Computerization of the TIR Procedure (WP.30/GE.1) and endorsed its Terms of Reference (ToR)² (ECE/TRANS/WP30/2019/9 and ECE/TRANS/WP.30/2019/9/Corr.1), pending approval by the United Nations Economic Commission for Europe (ECE) Executive Committee (EXCOM). EXCOM during its remote informal meeting (20 May 2020) approved the establishment of WP.30/GE.1 2022, based the ToR until on included in ECE/TRANS/WP.30/2019/9 and Corr.1, as contained in document ECE/TRANS/294 (ECE/EX/2020/L.2, para. 5(b)).3

Decision of the Inland Transport Committee para. 84 / ECE/TRANS/294 www.unece.org/fileadmin/DAM/trans/doc/2020/itc/ECE-TRANS-294e.pdf

² Terms of reference of the newly established Group approved by the Inland Transport Committee and the Executive Committee (EXCOM) of UNECE www.unece.org/fileadmin/DAM/trans/bcf/wp30/documents/2019/ECE-TRANS-WP30-2019-09e.pdf and corrigendum

Decision of EXCOM, ECE/EX/2020/L.2 / para. 5(b) www.unece.org/fileadmin/DAM/commission/EXCOM/Agenda/2020/Remote_informal_mtg_20_05_ 2020/Item_4_ECE_EX_2020_L.2_ITC_Sub_bodies_E.pdf

- 2. The ToR of the Group stipulate that the Group should focus its work on preparing a new version of the eTIR specifications, pending the formal establishment of the Technical Implementation Body (TIB). More specifically, the Group should (a) prepare a new version of the technical specifications of the eTIR procedure, and amendments thereto, ensuring their alignment with the functional specifications of the eTIR procedure; (b) prepare a new version of the functional specifications of the eTIR procedure, and amendments thereto, ensuring their alignment with the conceptual specifications of the eTIR procedure; (c) prepare amendments to the conceptual specifications of the eTIR procedure, upon requests by WP.30.
- 3. This document presents the technical glossary, the analysis to determine the needs in terms of capacity and scalability of the eTIR international system, the list of error codes of the eTIR system, the XSD and XML files, the code lists and the list of information security threats and related mitigation measures. All these aspects will be part of the eTIR technical specifications document.

II. The eTIR system

A. Technical glossary

4. This section provides in the following table the definition of all technical terms that are used in the eTIR technical specifications.

Table 1 **Technical glossary**

Term	Definition
Application programming interface	An application programming interface (API) is a software interface which is used for accessing an application or a service from a program.
Asymmetric encryption	A cryptographic system that uses two keys: a public key known to everyone and a private (or secret) key only known to the owner of the key pair. For example, when Alice wants to send a secured message to Bob, she uses Bob's public key to encrypt the message. Bob then uses his private key to decrypt it. RSA is an example of asymmetric algorithm.
Authentication	The process of verifying or testing that the claimed identity is valid. Authentication requires subjects to provide additional information that corresponds to the identity they are claiming. The most common form of authentication is using a password (this includes the password variations of personal identification numbers - PINs - and passphrases). Authentication verifies the identity of the subject by comparing one or more factors against the database of valid identities (that is, user accounts).
Certification authority	A certification authority (CA), is a recognized entity that holds a trusted position because the certificate that it issues binds the identity of a person or business to the public and private key pair (asymmetric cryptography) that are used to secure most transactions transmitted over the internet. For example, when a business or person wants to use these technologies, they request to a CA to issue them a certificate. The CA collects information about the person or business that it will certify before issuing the certificate.
Change advisory board	A Change Advisory Board (CAB) delivers support to a change-management team by advising on requested changes and assisting in the assessment and prioritization of changes. The CAB members should selectively be chosen to ensure that the requested changes are thoroughly checked and assessed from both a technical and business perspective.
Confidentiality	Confidentiality is the concept of the measures used to ensure the protection of the secrecy of data, objects, or resources. The goal of confidentiality protection is to prevent or minimize unauthorized access to data. Confidentiality focuses on security measures ensuring that no one other than the intended recipient of a message receives it or is able to read it. Confidentiality protection provides a means for authorized users to access and interact with resources, but it actively prevents unauthorized users from doing so.
Continuous integration	Continuous integration (CI) is the practice of automating the integration of code changes from multiple contributors into a single software project. It is a primary DevOps best practice, allowing

Term	Definition	
	developers to frequently merge code changes into a central repository where builds and tests then run. Automated tools are used to assert the correctness of the new code before integration.	
Defect	The IT literature usually makes a distinction between the terms "bug" and "defect". Indeed, a "bug" is the result of a coding error and a "defect" is a deviation from the requirements. In the context of this document, only the term "defect" is used and encompasses both meanings.	
Digital certificate	n cryptography, a digital certificate (or, simply, certificate in this document), is an electronic ocument used to prove the ownership of a public key. The certificate includes information about the key, information about the identity of its owner (called the subject), and the digital signature of n entity that has verified the certificate's contents (called the issuer). If the signature is valid, and he software examining the certificate trusts the issuer, then it can use that key to communicate ecurely with the certificate's subject.	
Digital signature	A digital code (chain of characters) that can be attached to an electronically transmitted message and that has two distinct goals: 1) Digitally signed messages assure the recipient that the message truly came from the claimed sender. They enforce non-repudiation (that is, they preclude the sender from later claiming that the message is a forgery) and 2) Digitally signed messages assure the recipient that the message was not altered while in transit between the sender and recipient (its integrity was preserved). This protects against both malicious modification (a third party altering the meaning of the message) and unintentional modification (because of faults in the communications process, such as electrical interference).	
Environments	During its lifecycle, a piece of software is developed and maintained on several environments that serve different purposes. Some of them are used for development, some others for testing and, finally, another one, the production environment, is used to operate the system when it is "live" and is available as a service to its end users	
Error	An error is a severe validation failure, which will cause the message to be rejected.	
Front-end web servers	A web server that receives request messages from the web service endpoints of the eTIF international system (or sends request messages to web service endpoints of other eTIF stakeholders).	
Git	Git is a version control system for tracking changes in any set of files, usually used for coordinating work among programmers collaboratively developing source code during software development. It objectives include optimized performance, data integrity, and support for distributed, non-linea workflows.	
Hash	A hash value (or simply hash), also called a message digest, is a value generated from a text. Thash is substantially smaller than the text itself, and is generated by a cryptographic hash function such a way that it is extremely unlikely that any other text can produce the same hash value.	
Integrated development environment	An integrated development environment (IDE) is a software application that provides comprehensive facilities to computer programmers for software development. An IDE normally consists of at least a source code editor, build automation tools and a debugger.	
Integrity	Integrity is the concept of protecting the reliability and correctness of data. Integrity protection prevents unauthorized alterations of data. It ensures that data remains correct, unaltered, and preserved. Properly implemented integrity protection provides a means for authorized changes while protecting against intended and malicious unauthorized activities (such as viruses and intrusions) as well as mistakes made by authorized users (such as mistakes or oversights).	
Java	Java is a class-based, object-oriented programming language that is designed to have as few implementation dependencies as possible. It is a general-purpose programming language intended to let application developers write once, run anywhere, meaning that compiled Java code can run on all platforms that support Java without the need for recompilation.	
Keystore	A keystore is a database used to store the certificates of the information systems of the owner of the keystore, and may include the certificates of trusted parties (truststore), for use by a program. Through its keystore, an entity can authenticate itself to other parties and may authenticate other parties as well.	
Load balancer	The load balancer is a software component that distributes a set of tasks over a set of resources (server nodes), with the aim of making their overall processing more efficient.	
Malware	Malware is any software intentionally designed to cause damage to a computer, server, client, or computer network. A wide variety of malware types exist, including computer viruses, worms, Trojan horses, ransomware, spyware, adware, rogue software, wiper and scareware.	
Multi-factor authentication	Multi-factor authentication is an electronic authentication method in which a user is granted access to a website or application only after successfully presenting two or more pieces of evidence (or	

Term	Definition	
	factors) to an authentication mechanism: knowledge (something only the user knows), possession (something only the user has), and inherence (something only the user is).	
Non-repudiation	Non-repudiation ensures that the subject of an activity or who caused an event cannot deny that the event occurred. Non-repudiation prevents a subject from claiming not to have sent a message, not to have performed an action, or not to have been the cause of an event. It is made possible through identification, authentication, authorization, accountability, and auditing. Non-repudiation can be established using digital certificates, session identifiers, transaction logs, and numerous other transactional and access control mechanisms.	
OASIS	The Organization for the Advancement of Structured Information Standards (OASIS) is a non-profit, international consortium whose goal is to promote the adoption of product-independent standards.	
Open-source sofware	Open-source software (OSS) is computer software that is released under a license in which the copyright holder grants users the rights to use, study, change, and distribute the software and its source code to anyone and for any purpose. Open-source software may be developed in a collaborative public manner. Open-source software is a prominent example of open collaboration.	
Public key infrastructure	A public key infrastructure (PKI) is a set of roles, policies, hardware, software and procedures needed to create, manage, distribute, use, store and revoke digital certificates and manage asymmetric encryption.	
Receiver	In the context of this document, the "receiver" is the information system of the eTIR stakeholder which receives an eTIR message sent by another stakeholder, and processes it.	
Role-based access control	Role-based access control (RBAC) is a policy-neutral access-control mechanism defined around roles and privileges. The components of RBAC such as role-permissions, user-role and role-role relationships make it simple to perform user assignments. RBAC can be used to facilitate administration of security in large organizations with hundreds of users and thousands of permissions.	
RSA	The RSA algorithm was invented by Ronald L. Rivest, Adi Shamir, and Leonard Adleman in 1977. It is an asymmetric encryption algorithm using two different keys with a mathematic relationship to each other. The public key and private keys are carefully generated using the RSA algorithm; they can be used to encrypt information or sign it.	
Sender	In the context of this document, the "sender" is the information system of the eTIR stakeholder which generates and sends an eTIR message to another eTIR stakeholder.	
Service-level agreement	A service-level agreement (SLA) is a commitment between a service provider and a client Particular aspects of the service – quality, availability, responsibilities – are agreed between the service provider and the client.	
Single point of failure	A single point of failure (SPOF) is a part of a system that, if it fails, will stop the entire system from working. SPOFs are undesirable in any system with a goal of high availability or reliability, be it business practice, software application, or other industrial system.	
SOAP	Simple Object Access Protocol (SOAP) is a messaging protocol specification for exchanging information in the implementation of web services. It is an XML-based protocol consisting of three parts:	
	• an envelope, which defines the message structure (a header and a body) and how to process it;	
	 a set of encoding rules for expressing instances of application-defined data types; a convention for representing procedure calls and responses. 	
Software entropy	The second law of thermodynamics, in principle, states that a closed system's disorder cannot be reduced, it can only remain unchanged or increase. A measure of this disorder is entropy. According to studies, this law also seems plausible for software systems: as a system is modified, its disorder or entropy, tends to increase. This is known as software entropy. The process of code refactoring can result in stepwise reductions in software entropy.	
Standard operating procedure	A standard operating procedure (SOP) is a set of step-by-step instructions compiled by an organization to help staff members carring out routine operations. SOPs aim at achieving efficiency, quality output and uniformity of performance, while reducing miscommunication and failure to	
Token	comply with the organization's regulations. A token (sometimes called a security token) is an object that controls access to a digital asset. Traditionally, this term has been used to describe a hardware authenticator, a small device used to create a one-time password that the owner types in a login screen along with an ID and a PIN. However, in the context of web services and with the emerging need for devices and processes to authenticate to each other over open networks, the term token has been expanded to include	

Term	Definition	
	software mechanisms too. A token may be an X.509 certificate, that associates an identity to a public key for example.	
Total cost of ownership	The total cost of ownership (TCO) represents the total amount of money that the owner of an information system had to spend during the life cycle of the latter. All costs (direct and indirect) are taken into account.	
Truststore	A truststore is a keystore file that contains the certificates from other parties that you expect to communicate with, or from Certificate Authorities that you trust, to identify other parties.	
Virtual server farm	A virtual server farm is a networking environment that employs multiple application and infrastructure servers running on two or more physical servers using a server virtualization program. This architecture offers several benefits, including server consolidation, redundancy, failover, high availability and optimized resource utilization.	
Web service	Virtual service/function exposed over a network (private or internet) allowing for system to system communication using messages following a strict format. Machine-to-machine is another term to define this type of communication.	
Web Services Security	The Web Services Security (WS-Security) specification describes enhancements to SOAP 1.1 that increase the protection (integrity) and confidentiality of the messages. These enhancements include functionality to secure SOAP messages through XML digital signature, confidentiality through XML encryption, and credential propagation through security tokens (e.g. X.509 token).	
Web Service Description Language	Web Service Description Language (WSDL) is an XML-based interface description language that is used for describing the functionality offered by a web service.	
X.509 certificate	X.509 is a common format for digital certificates, that is widely used on internet with the TLS protocol. An X.509 certificate specifies a binding between a public key and a set of attributes that includes (at least) a subject name, issuer name, serial number and validity interval. It is defined in the request for comments (RFC) document 5280. ⁴	
X.509 token	The X.509 token represents the digital signature generated using the X.509 certificate of the sender, and which will be used to authenticate the entity sending the message. It is therefore part of the message itself, in the header section of the SOAP envelope.	
XML	XML stands for eXtensible Markup Language which is a language that defines a set of rules for encoding documents in a format that is both human-readable and machine-readable. It is used by SOAP to encode messages sent by web services.	
XML signature	The XML signature specification is a joint effort between W3C and IETF. XML signatures provide integrity, message authentication and/or signer authentication services for data of any type, whether located within the XML that includes the signature or elsewhere.	
XML Schema Definition	XML Schema Definition (XSD) is a W3C recommendation that describes how the elements in an XML document are structured and formatted.	

B. Analysis to determine the needs in terms of capacity and scalability of the eTIR international system

1. Introduction

- 5. This section analyses, based on existing data (February 2021) and on experience acquired during the development of the eTIR international system, the requirements in terms of throughput of messages and volume of data to be handled by the eTIR international system.
- 6. Since the eTIR international system is not yet in operation, this analysis cannot use real data and, therefore, takes a cautious approach by always considering worst case scenarios and providing estimates based on maxima rather than averages. When the eTIR international system starts to be used in production, ECE will revisit this analysis to provide better forecasts in terms of capacity requirements for the coming years and link them with the number of eGuarantees sold.

⁴ See tools.ietf.org/html/rfc5280

2. Analysis on the number of messages

7. Based on the most recent statistics on sales of TIR Carnets (and on the number of eGuarantees issued in the context of the eTIR pilot projects), the following table shows an aggregated view of the past statistics, combined with estimates of sales of TIR Carnets and eGuarantees for the next five years.

Table 2
Statistics and forecast of the sales of TIR Carnets and eGuarantees

Year	Number of TIR Carnet sold	Number of eGuarantees sold	Increase of the number of eGuarantees sold per year
2001	2 707 950	N/A	N/A
2002	3 095 200	N/A	N/A
2003	3 298 000	N/A	N/A
2004	3 211 050	N/A	N/A
2005	3 240 650	N/A	N/A
2006	3 599 850	N/A	N/A
2007	3 076 250	N/A	N/A
2008	3 253 800	N/A	N/A
2009	2 230 400	N/A	N/A
2010	2 822 200	N/A	N/A
2011	3 074 500	N/A	N/A
2012	3 158 300	N/A	N/A
2013	2 920 150	N/A	N/A
2014	1 945 050	N/A	N/A
2015	1 500 450	(eTIR pilot) 5	N/A
2016	1 223 400	(eTIR pilot) 59	N/A
2017	1 154 650	(eTIR pilot) 82	N/A
2018	1 020 650	(eTIR pilot) 81	N/A
2019	858 100	(eTIR pilot) 78	N/A
2020	679 300	(eTIR pilot) 2	N/A
2021	(estimate) 600 000 ((eTIR pilot) 63, (estimate) 5 000	N/A
2022	(estimate) 550 000	(estimate) 15 000	200%
2023	(estimate) 500 000	(estimate) 60 000	300%
2024	(estimate) 450 000	(estimate) 200 000	233%
2025	(estimate) 400 000	(estimate) 400 000	100%
2026	(estimate) 300 000	(estimate) 700 000	75%

- 8. In order to calculate the estimates on eGuarantees sold, the following factors were taken into consideration:
- (a) The number of countries that have initiated interconnection projects between their national customs system and the eTIR international system during 2020;
- (b) The number of countries that have already expressed an interest to perform this interconnection for which projects should most likely start during 2021;
- (c) The numbers of TIR Carnets issued in recent years along the corridors involving those contracting parties that have launched interconnection projects or will soon do so;
- (d) The efforts undertaken or interest expressed by Regional Economic Organizations in order to prepare proofs of concept to interconnect their customs union system with the eTIR international system and the possible dates for these interconnections;

- (e) The results of the "study on the reasons for the decline in the number of TIR Carnets used" document (hereafter "the study") prepared by the TIR Executive Board (TIREXB) in 2020 and, especially, the trends related to the TIR Carnets sales;
- (f) The efforts that ECE and the international organization will make in the coming years in order to attract more countries and markets (intermodal, postal) and expand the TIR Convention to new regions as described in the study;
- (g) Neither any sensitivity analysis nor other scientific forecasting method was used, so far, to prepare such estimations.
- 9. The estimates on the increase in the sale of eGuarantees on a yearly basis show that, after the first years of adoption, the long term increase in percentage tends to become linear and could remain that way if the number of contracting parties to the TIR Convention connected to the eTIR international system continue to increase as well. We should, therefore, design the eTIR international system so that it can easily scale with a steady yearly increase of 100% of TIR transports following the eTIR procedure.
- 10. The number of messages sent and received per TIR transport depends on several criteria: the number of TIR operations, the number of pre-declaration messages (advance TIR data, advance amendment data and cancel advance data messages) sent by the holder, the number of uses of the query mechanism, the number of times that seals are changed, whether any incident or accident occurs during the TIR transport, etc. The following table shows several scenarios of TIR transports and details, for each of them, the maximum number of messages received and sent by the eTIR international system (if the holder sends the pre-declaration messages via the eTIR international system) as well as the number of request messages only.

Table 3
Messages received and sent by the eTIR international system by scenarios

Number of TIR Operations	Messages received and sent for the TIR operations	Messages received and sent for the pre- declaration	Total number Number of messages messon per scenario	0 1
2	E1/E2, I1/I2, I7/I8, (I15/I16) x 2, (I9/I10, I11/I12, I13/I14) x 2, (E7/E8) x 9, (E5/E6) x 9, (I5/I6) x 2	E9/E10	64	21
3	E1/E2, I1/I2, I7/I8, (I15/I16) x 2, (I9/I10, I11/I12, I13/I14) x 3, (E7/E8) x 12, (E5/E6) x 12, (I5/I6) x 3	E9/E10	88	28
4	E1/E2, I1/I2, (I7/I8) x 2, (I15/I16) x 5, (I9/I10, I11/I12, I13/I14) x 4, (E7/E8) x 14, (E5/E6) x 14, (I5/I6) x 4	E9/E10, E11/E12	110	36
4	E1/E2, I1/I2, (I7/I8) x 2, (I15/I16) x 5, (I9/I10, I11/I12, I13/I14) x 4, (E7/E8) x 14, (E5/E6) x 14, (I5/I6) x 4		118	40
5	E1/E2, I1/I2, (I7/I8) x 2, (I15/I16) x 7, (I9/I10, I11/I12, I13/I14) x 5, (E7/E8) x 17, (E5/E6) x 17, (I5/I6) x 5		136	44
6	E1/E2, I1/I2, (I7/I8) x 2, (I15/I16) x 9, (I9/I10, I11/I12, I13/I14) x 6, (E7/E8) x 20, (E5/E6) x 20, (I5/I6) x 6		160	51
7	E1/E2, I1/I2, (I7/I8) x 3, (I15/I16) x 15, (I9/I10, I11/I12, I13/I14) x 7, (E7/E8) x 24, (E5/E6) x 24, (I5/I6) x 7	E9/E10, E11/E12, E11/E12, E11/E12	198	61
8	E1/E2, I1/I2, (I7/I8) x 3, (I15/I16) x 18, (I9/I10, I11/I12, I13/I14) x 8, (E7/E8) x 27, (E5/E6) x 27, (I5/I6) x 8	E9/E10, E11/E12, E11/E12, E11/E12	224	68
9	E1/E2, I1/I2, (I7/I8) x 3, (I15/I16) x 21, (I9/I10, I11/I12, I13/I14) x 9, (E7/E8) x 30, (E5/E6) x 30, (I5/I6) x 9	E9/E10, E11/E12, E11/E12, E11/E12	250	75

Number of TIR Operations	Messages received and sent for the TIR operations	Messages received and sent for the pre- declaration		Number of request messages only, per scenario
10	E1/E2, I1/I2, (I7/I8) x 4, (I15/I16) x 30, (I9/I10, I11/I12, I13/I14) x 10, (E7/E8) x 34, (E5/E6) x 34, (I5/I6) x 10	E9/E10, E11/E12, E11/E12, E11/E12, E11/E12	292	85

- 11. In 2020, IRU reported the following sales⁵: 4,300 TIR Carnets of 4 vouchers (0.6%), 544,200 TIR Carnets of 6 vouchers (80%), 131,050 TIR Carnets of 14 vouchers (19.3%) and 0 TIR Carnets of 20 vouchers. Therefore, most of the TIR transports performed on that year had 3 TIR operations (6 vouchers). Given the previous table, and while taking a cautious approach with regard to the capacity of the eTIR international system, we will consider that the average total number of messages exchanged per TIR transport is 120 and that the average number of request messages is 40.
- 12. We will also assume that the average number of messages exchanged per TIR transport will also increase by 5% per year. This assumption is supported by the fact that more contracting parties will be connected to the eTIR international system over time, therefore increasing the possibilities for longer TIR transports following the eTIR procedure. Finally, new versions of the eTIR specifications could also contribute to this increase.
- 13. The following table gives estimates of the number of messages that the eTIR international system could send and receive, and should, therefore, be able to support, over the next years.

Table 4
Estimated number of messages to be supported by the eTIR international system

Year	A. Estimated number of eGuarantees sold	B. Estimated average number of all messages per TIR transport	C. Estimated average number of all messages per year in millions (A x B)	D. Estimated average number of requests messages per TIR transport	E. Estimated average number of request messages per year in millions (A x D)
2021	5 000	130	0.65	40	0.20
2022	15 000	137	2.06	42	0.63
2023	60 000	143	8.58	44	2.64
2024	200 000	150	30.00	46	9.20
2025	400 000	158	63.20	49	19.60
2026	700 000	166	116.20	51	35.70

14. We can then formulate, as a hypothesis, that the maximum number of messages would be between five and ten times the average number of messages. We can then produce the following two tables: one for the maximum number of messages received and sent by the eTIR international system and another for the maximum number of request messages received, both of them per minute.

Table 5
Estimated maximum number of messages received and sent

Year	A. Estimated average number of all messages per year in millions	B. Estimated average number of all messages per minute (A/(365x24x60))	Estimated lower bound of maximum number of all messages per minute (Bx5)	Estimated upper bound of maximum number of all messages per minute (Bx10)
2021	0.65	1.24	6.2	12.4
2022	2.06	3.92	20.0	39.2

⁵ See Informal document WP.30/AC.2 (2021) No.5

Year	A. Estimated average number of all messages per year in millions	B. Estimated average number of all messages per minute (A/(365x24x60))	Estimated lower bound of maximum number of all messages per minute (Bx5)	Estimated upper bound of maximum number of all messages per minute (Bx10)
2023	8.58	16.32	81.6	163.2
2024	30.00	57.23	286.2	572.3
2025	63.20	120.57	602.9	1 205.7
2026	116.20	221.69	1 108.5	2 216.9

Table 6
Estimated maximum number of request messages received

Year	A. Estimated average number of request messages per year in millions	B. Estimated average number of request messages per minute (A/(365x24x60))	Estimated lower bound of maximum number of request messages per minute (Bx5)	Estimated upper bound of maximum number of request messages per minute (Bx10)
2021	0.20	0.38	1.9	3.8
2022	0.63	1.20	6.0	12.0
2023	2.64	5.02	25.1	50.2
2024	9.20	17.50	87.5	175.0
2025	19.60	37.29	186.5	372.9
2026	35.70	67.92	339.6	679.2

3. Analysis on the throughput of messages

15. The throughput of messages to be supported by the eTIR international system is defined as the number of request messages to be received and processed for a given unit of time. Based on the previous analysis, the average and the upper bound of the maximum number of request messages per minute, are selected.

Table 7
Estimated average and maximum requirements for the throughput of messages

Year	Estimated average number of request messages per minute	Estimated maximum number of request messages per minute
2021	0.38	3.8
2022	1.20	12.0
2023	5.02	50.2
2024	17.50	175.0
2025	37.29	372.9
2026	67.92	679.2

4. Analysis on the volume of data

- 16. In addition to the estimates on the throughput of messages that would need to be supported by the eTIR international system, it is also important to take into consideration the factor of the size of these messages and the total volume of data that would need to be exchanged, processed and recorded by the eTIR international system.
- 17. Based on the experience acquired during the development of the eTIR international system, the size of 70% of the messages is under 10 KB, the size of 25% of the messages is between 11KB and 50 KB and the size of the remaining 5% of the messages is between 51KB and 20 MB (the maximum size allowed). We assume that 5% of the messages would embed additional documents (which significantly increases the size of the message).
- 18. Therefore, we can assume that the average size of a message would be (90% x 5KB) + (9% x 25 KB) + (1% x 5 MB) = 57 KB. Building on previous results, we can deduce an

estimate on the maximum total volume of data that would need to be handled by the eTIR international system and, in particular, to be stored in the eTIR logs.

Table 8
Estimated maximum volume of data to be stored in the eTIR logs

Year	A. Estimated upper bound of maximum number of all messages per minute	B. Estimated maximum volume of data per minute in MB (Ax0.057)	C. Estimated maximum volume of data per year in TB (Bx60x24x365)
2021	12.4	0.7	0.371
2022	39.2	2.2	1.174
2023	163.2	9.3	4.889
2024	572.3	32.6	17.146
2025	1 205.7	68.7	36.121
2026	2 216.9	126.4	66.417

19. Only a small subset of this volume is stored in the eTIR database. First, only the request messages are processed and recorded in this storage location. Then, the additional documents are not stored in the database, so we can remove the 1% largest messages, which gives the following new average size for a message: (91% x 5KB) + (9% x 25 KB) = 6.8 KB. Then, in each message, its header is not stored in the database and only the values of the body of the message are stored, which represent between 3% and 10% of the size of the message, therefore a maximum of 0.68 KB.

Table 9
Estimated maximum volume of data to be stored in the eTIR database

Year	A. Estimated upper bound of maximum number of request messages per minute	B. Estimated maximum volume of data per minute in KB (Ax0.68)	C. Estimated maximum volume of data per year in GB (Bx60x24x365)
2021	3.8	2.6	1.36
2022	12.0	8.2	4.29
2023	50.2	34.1	17.94
2024	175.0	119.0	62.55
2025	372.9	253.6	133.28
2026	679.2	461.9	242.75

20. Documents embedded in the messages are stored separately, in the eTIR documents system. As for the eTIR database, only the request messages are considered. Based on previous assumptions, we can, therefore, only keep the 1% largest messages holding embedded documents, which gives the following new average size for a message: 1% x 5 MB = 50 KB. Similarly, we can, therefore, infer an estimate on the maximum total volume of data that would need to be stored in the eTIR documents.

Estimated maximum volume of data to be stored in the eTIR documents

Year	A. Estimated upper bound of maximum number of request messages per minute	B. Estimated maximum volume of data per minute in MB (Ax0.05)	C. Estimated maximum volume of data per year in TB (Bx60x24x365)
2021	3.8	0.2	0.100
2022	12.0	0.6	0.315
2023	50.2	2.5	1.319
2024	175.0	8.8	4.599
2025	372.9	18.6	9.800
2026	679.2	34.0	17.849

5. Conclusions

- 21. The estimations and forecasts in terms of throughput of messages and volume of data are only as good as the various assumptions are correct. Since the eTIR international system is not yet in operation, this analysis lacks actual data. For this reason, the eTIR international system should be designed while considering the capacity and scalability requirements for the first two years only, as there is a high probability that real data will adjust several assumptions, which will totally change the calculations and forecasts for the next years.
- 22. For this reason, it is strongly advised to perform this analysis again, six months after the eTIR international system is deployed in production in order to review the assumptions, redo the calculations and conclude with more reliable estimates and forecasts for the future needs in terms of capacity and scalability of the eTIR international system. Then, it will also be advised to review this analysis on a yearly basis to continuously refine it.

C. Error codes

- 23. This section provides additional details on the error codes used in the context of the eTIR system.
- 24. The code list 99 defines all error codes that can be used in response messages to indicate problems that occurred while processing the corresponding request message. This code list is specific to the eTIR system and ECE has been continuously updating this list presented in the following table.

Table 11 Error code list (CL99)

Code	Name	Description
100	Invalid message	The message is invalid, and no additional details are available for this error
101	Missing field	A required field is missing in the message
102	Invalid domain for the value	A value is outside a defined list of acceptable values
103	Malformed date	A field containing a date value cannot be properly converted
104	Not an integer	A numeric field contains a value that is not numeric
105	Field value length exceeded	A String field contains a value with too many characters
106	Invalid pattern	A String field does not match the pattern for the field defined in the XML Schema Definition of the message
107	Invalid field	The specified field does not follow the order defined in the XML Schema Definition of the message
108	Missing XML attribute	The specified XML tag is missing a required attribute (e.g. formatCode for all date fields)
109	Invalid XML attribute	The specified XML tag has an invalid attribute value (e.g. formatCode for all date fields)
151	Condition C001 failure	The condition C001 is not satisfied
152	Condition C002 failure	The condition C002 is not satisfied
153	Condition C003 failure	The condition C003 is not satisfied
154	Condition C004 failure	The condition C004 is not satisfied
155	Condition C005 failure	The condition C005 is not satisfied
156	Condition C006 failure	The condition C006 is not satisfied
157	Condition C007 failure	The condition C007 is not satisfied
158	Condition C008 failure	The condition C008 is not satisfied
159	Condition C009 failure	The condition C009 is not satisfied
160	Condition C010 failure	The condition C010 is not satisfied
181	Rule R001 failure	The rule R001 is not satisfied

Code	Name	Description
182	Rule R001 failure	The rule R002 is not satisfied
188	Rule R008 failure	The rule R008 is not satisfied
190	Rule R010 failure	The rule R010 is not satisfied
200	Invalid state	The state of an internal object is invalid, and no additional details are available for this error
201	Guarantee not acceptable	The guarantee is not in a state that allows to accept it
203	Guarantee not cancellable	The guarantee is not in a state that allows to cancel it
204	Guarantee already registered	The guarantee has already been registered
205	Guarantee already cancelled	The guarantee is already cancelled or the request to cancel it has already been sent
210	Operation already started	The operation is already started
211	Operation already terminated	The operation has already been completed
212	Operation already discharged	The operation is already discharged
213	Operation not yet started	The operation is not yet started
214	Operation ID already registered	The "refusal to start" is an operation on its own and must have a unique operation ID
215	Operation sequence already registered	The "refusal to start" is an operation on its own and must have a unique operation sequence
216	Refusal to start not authorized	The "refusal to start" cannot be performed because of the current guarantee status or because it is the first operation for this transport
220	Declaration not yet received	The operation cannot be started because the declaration was not received
299	Duplicate message	The same message was already received from the same source
300	Invalid operation	An invalid operation was performed, and no additional details are available for this error
301	Guarantee not found	The guarantee was not found in the database
302	Guarantee chain not found	The guarantee chain was not found in the database
303	Guarantee type not found	The guarantee type was not found in the database
304	Customs office not found	This error code is not used in the eTIR specifications v4.3
305	Country not found	The country was not found in the database
306	Control type not found	The control type was not found in the database
307	Declaration not found	The related declaration was not found in the database
308	Forward information not found	The eTIR international system could not find information on whom to forward the message to
320	Holder/Guarantee mismatch	The holder id value and the guarantee reference value do not match what is recorded in the database
321	Holder not authorized	The holder is not authorized in the International TIR Data Bank (ITDB)
322	Holder not found	The holder is not found in ITDB
330	Guarantee chain not authorized	The guarantee chain is not authorized in the database
331	Guarantee chain/Guarantee mismatch	The guarantee chain code value and the guarantee reference value do not match what is recorded in the database
332	Guarantee type/Guarantee mismatch	The guarantee type parameter and the guarantee reference parameter do not match what is recorded in the database
333	Declaration reference not found	The FunctionalReferenceID value does not match what is already recorded in the database
334	Declaration already cancelled	The declaration could not be modified because it was already cancelled
400	eTIR problem	An internal error in the eTIR international system occurred and no additional details are available for this error
500	Customs declaration processing error	The message was not accepted by customs and no additional details are available for this error
501	Advance TIR data not accepted	Customs did not accept the advance TIR data

Code	Name	Description
502	Advance amendment data not accepted	Customs did not accept the advance amendment data

25. Not all error codes can be indicated in response messages and the following table displays which error codes can be referenced in response messages. This information is useful for the IT experts of the eTIR stakeholders to properly implement the follow-up actions when receiving specific error codes. This list is presented as it is at the time of the preparation of this document. Kindly check on the eTIR web site⁶ to consult its latest version.

Table 12 List of possible error codes by response message

Error code	12	<i>I4</i>	16	I8	110	I12	I14	I16	I18	I20	E2	E4	E6	E8	E10	E12	E14

26. Finally, the following table gathers a set of recommended actions for consideration of the IT experts of the information system, when receiving a response message with one or more error codes.

Table 13 **Recommended actions when receiving error codes**

Code	Name	Recommended actions
100	Invalid message	Kindly check the message itself and its format as it is not recognized by the eTIR international system. Kindly contact the eTIR service desk to send the content of the message communicated, the timestamps and the steps to reproduce this issue in order to address it.
101	Missing field	Kindly check the message parameters, in particular the parameters marked as mandatory in the message description section of this document, and make sure that all mandatory parameters are part of the message.
102	Invalid domain for the value	Kindly check the coded parameter, its values and corresponding code lists. Make sure that each coded parameter is using one of the values of the corresponding code list.
103	Malformed date	Kindly check the date parameters and their format. Make sure that each date format has the format indicated, that the value follows the format/pattern and that the "formatCode" attribute is set to the correct value.
104	Not an integer	Kindly check the integer parameters. Make sure that each integer parameter has a value that can successfully be casted as an integer.
105	Field value length exceeded	Kindly check the parameter value lengths. Make sure that each parameter length does not exceed the max length as defined in the documentation in the Format column.
106	Invalid pattern	Kindly check the pattern of the parameter value as it does not match the requirements set for this attribute in XML Schema Definition of the message.
107	Invalid field	Kindly check the element specified as it may not follow the order defined in the XML Schema Definition of the message.
108	Missing XML attribute	Kindly check that all XML tags contain their required attribute, in particular all dates should contain the attribute formatCode to specify the format in which the date is sent.
109	Invalid XML attribute	Kindly check that all XML tag attribute values follow the specified code list, in particular the attribute formatCode for dates can only be either '102' or '208'.
120	Invalid eTIR specifications version	Kindly check that your information system, as well as the value of your message metadata fields, is in line with the latest version of the eTIR international system and the eTIR specifications.
151	Condition C001 failure	Kindly check the parameters constrained by the condition C001 and make sure their values respect the pseudo code of the condition.
152	Condition C002 failure	Kindly check the parameters constrained by the condition C002 and make sure their values respect the pseudo code of the condition.
153	Condition C003 failure	Kindly check the parameters constrained by the condition C003 and make sure their values respect the pseudo code of the condition.
154	Condition C004 failure	Kindly check the parameters constrained by the condition C004 and make sure their values respect the pseudo code of the condition.
155	Condition C005 failure	Kindly check the parameters constrained by the condition C005 and make sure their values respect the pseudo code of the condition.
156	Condition C006 failure	Kindly check the parameters constrained by the condition C006 and make sure their values respect the pseudo code of the condition.
157	Condition C007 failure	Kindly check the parameters constrained by the condition C007 and make sure their values respect the pseudo code of the condition.
158	Condition C008 failure	Kindly check the parameters constrained by the condition C008 and make sure their values

Code	Name	Recommended actions
		respect the pseudo code of the condition.
159	Condition C009 failure	Kindly check the parameters constrained by the condition C009 and make sure their values respect the pseudo code of the condition.
160	Condition C010 failure	Kindly check the parameters constrained by the condition C010 and make sure their values respect the pseudo code of the condition.
181	Rule R001 failure	Kindly check the parameters constrained by rule R001 and make sure their values respect the conditions set by the rule.
182	Rule R002 failure	Kindly check the parameters constrained by rule R002 and make sure their values respect the conditions set by the rule.
188	Rule R008 failure	Kindly check the parameters constrained by rule R008 and make sure their values respect the conditions set by the rule.
190	Rule R010 failure	Kindly check the parameters constrained by rule R010 and make sure their values respect the conditions set by the rule.
200	Invalid state	Kindly check the state of the referred object (transport, guarantee,) and make sure it is consistent with the eTIR international system requested web service called.
201	Guarantee not acceptable	Kindly check the state of the guarantee you tried to accept, and make sure it is correct according to the workflow described in the guarantee state diagram.
203	Guarantee not cancellable	Kindly check the state of the guarantee you tried to cancel, and make sure it is correct according to the workflow described in the guarantee state diagram.
204	Guarantee already registered	Kindly check the state of the guarantee you tried to register as it seems to be already registered. You may use Query guarantee web service to check its existence in the eTIR international system.
205	Guarantee already cancelled	Kindly check the state of the guarantee you tried to register as it seems to be already cancelled. You may use Query guarantee web service to check its existence in the eTIR international system.
210	Operation already started	This message tries to start a TIR operation which has already been started. Make sure that this message is not a duplicate of a previously sent message and verify the values set in its parameters.
211	Operation already terminated	This message tries to terminate a TIR operation which has already been terminated. Make sure that this message is not a duplicate of a previously sent message and verify the values set in its parameters.
212	Operation already discharged	This message tries to discharge a TIR operation which has already been discharged. Make sure that this message is not a duplicate of a previously sent message and verify the values set in its parameters.
213	Operation not yet started	This message tries to perform an operation on a TIR operation which should be started and that is not yet started. Make sure that this message is sent in the right order and verify the values set in its parameters.
214	Operation ID already registered	Kindly check the message ID and that it is not conflicting with another operation ID.
215	Operation sequence already registered	Kindly check the last operation's sequence number for this transport and increment it
216	Refusal to start not authorized	A refusal to start cannot take place if this the first operation registered or if the guarantee has not been accepted. Kindly check that your guarantee reference is also correct.
220	Declaration not yet received	This message tries to perform an operation whereas the Declaration has not yet been received. Make sure that this message is sent in the right order and verify the values set in its parameters.
299	Duplicate message	Kindly check the message already sent to this endpoint as this message has already been received by the eTIR international system.
300	Invalid operation	Kindly check the message content as it triggered a technical error in the eTIR international system but this one could not identify the source of the issue.
301	Guarantee not found	Kindly check the value of the guarantee reference ID in the message and make sure it matches the value received in previous messages.
302	Guarantee chain not found	Kindly check the value of the guarantee chain ID in the message and make sure it matches the value received in previous messages.

Code	Name	Recommended actions
303	Guarantee type not found	Kindly check the value of the guarantee type in the message and make sure it belongs to the code list "Guarantee type code (eTIR)" (CL12), and that it matches the value received in previous messages.
304	Customs office not found	This error code is not used in the eTIR specifications v4.3.
305	Country not found	Kindly check the value of the country code in the message and make sure it matches the value received in previous messages and that it belongs to the code list "Country name code (ISO 3166-1-alpha-2)" (CL04).
306	Control type not found	Kindly check the value of the control type in the message and make sure it matches the value received in previous messages and that it belongs to the code list "Control type code (eTIR)" (CL25).
307	Declaration not found	Kindly check the value of the guarantee reference ID in the message and make sure it matches the value received in previous messages.
308	Forward information not found	Kindly check that the advance data submitted is correct. If the error persists, please contact the eTIR service desk and send the content of the message communicated, the timestamps and the steps to reproduce this issue in order to address it.
320	Holder/Guarantee mismatch	Kindly check the format and value of the TIR Carnet holder in the message and make sure it matches the value received in previous messages. If it does, kindly check the existence of the TIR Carnet holder and its status using either "I3 - Get holder information" message, ITDB dedicated web services or ITDB web application.
321	Holder not authorized	Kindly check the value of the TIR Carnet holder in the message and make sure it matches the value received in previous messages. If it does, kindly check the status of the TIR Carnet holder using either eTIR I3 message, ITDB web service or ITDB web application.
322	Holder not found	Kindly check the value of the TIR Carnet holder in the message and make sure it matches the value received in previous messages. If it does, kindly double check the id of the TIR Carnet holder using either eTIR I3 message, ITDB web service or ITDB web application.
330	Guarantee chain not authorized	Kindly check the value of the guarantee chain ID in the message and make sure it matches the value received in previous messages.
331	Guarantee chain/Guarantee mismatch	Kindly check the value of the guarantee chain ID in the message and make sure it matches the value received in previous messages.
332	Guarantee type/Guarantee mismatch	Kindly check the value of the guarantee type ID in the message and make sure it matches the value received in previous messages.
333	Declaration reference not found	Kindly check the reference ID of the advance data message that you want to cancel. Note that if the previous message was sent directly to the national customs system, it cannot be cancelled using the eTIR international system forwarding mechanism.
334	Declaration already cancelled	Kindly check the reference ID of the advance data you want to cancel. The reference ID provided may have already been canceled.
400	eTIR problem	Kindly contact the eTIR service desk to send the content of the message communicated, the timestamps and the steps to reproduce this issue in order to address it.
500	Customs declaration processing error	Kindly contact the related customs authorities to request additional information on the refusal of the advance data.
501	Advance TIR data not accepted	Kindly review the content of the advance TIR data as some information could not be accepted by the customs authorities. If you cannot find the cause of the refusal, please contact them to request additional information on the refusal of the advance TIR data.
502	Advance amendment data not accepted	Kindly review the content of the advance amendment data as some information could not be accepted by the customs authorities. If you cannot find the cause of the refusal, please contact them to request additional information on the refusal of the advance TIR data.

D. XML and XSD files

1. The eTIR messages as XML files

27. The eTIR messages are exchanged between the actors of eTIR system using the XML format and the implementation of the eTIR messages using XML follows the WCO Data Model XML Guidelines. As the messages can contain characters from more than one

ISO-8859 character set, the use of Unicode is mandatory and, therefore, the encoding adopted is UTF-8.

28. Both the classes and attributes of the eTIR messages are mapped to XML elements. For all XML mappings, the XML tags come from the WCO Data Model to ensure compliancy and they follow the PascalCase naming convention⁷, except for abbreviations which are in upper case (for example: AuthorName, RegistrationNationalityCode, ID, MIMECode).

2. The XML Schema Definitions (XSD) files

- 29. The structure of the eTIR messages is defined using XML Schema Definitions (XSD) files and the latest versions of the XSD files are available on the eTIR web site on this page: https://www.etir.org/xsd-files.
- 30. XSD files can be used for two purposes:
 - To automatically generate classes to easily implement the web service endpoint to communicate with the information systems that use the eTIR messages. For instance, in Java, the JAXB library can be used for this purpose;
 - To automatically perform partial validation of incoming eTIR messages to verify the structure of the message and the format of the values⁸. For instance, in Java, the javax.xml.validation.Validator library can be used for this purpose.
- 31. A short description of each types of XSD files is provided below:
 - Data sets XSD (eTIR_DataSets.xsd): shall contain the definition of the complex and simple XSD types used as data types for the XML elements representing the classes and attributes in message specific XSDs. Complex and simple XSD types that are identified to be used repeatedly in messages shall be grouped under a common definition in this file. This factorization of the common types prevent duplication of source code when generating the classes;
 - Message specific XSDs (eTIR_xxx.xsd): shall define only the structure of each
 message. Definition of simple or complex types that are common to other messages
 shall be defined in the data set XSD;
 - Code lists XSD (eTIR_CodeLists.xsd): shall contain the definition of the code lists used in the attributes of the eTIR messages as simple types. It shall provide an enumeration of the applicable values for each code list;
 - Metadata XSD (eTIR_Metadata.xsd): shall define the set of metadata classes and attributes that are present at the beginning of each and every eTIR message.
- 32. The following conventions shall be respected by the XSDs:
 - Cardinality: the cardinality of fields shall be defined using the "minOccurs" and "maxOccurs" XML attributes as detailed below, keeping in mind that their default value is 1:
 - Classes repetitions: shall be defined in the XSDs using the XML attribute "maxOccurs";
 - Optionality: optional attributes or classes shall be defined in the XSDs by setting the "minOccurs" XML attribute of the corresponding element equal to zero. If this XML attribute is not used, the attribute or class is required;
 - Namespaces: each XSD has to "import" the required namespaces and then reuse the necessary components by using its origin (i.e. the namespace) as a prefix.

⁷ See techterms.com/definition/pascalcase

None of the rules and conditions are validated using the XSD files, so a specific validation layer needs to be implemented for those aspects.

- Target namespace: each XSD is associated with a distinct target namespace which is of the form "etir:xxx:vw.y" where xxx is the code of the eTIR message or DataSets or CodeLists or Metadata, and vw.y corresponds to the version of the eTIR specifications (like v4.3).
- Version: each XSD shall have a version number, based on the version of the eTIR specifications, using the form "w.y.z" where w.y.z corresponds to the version of the eTIR specifications (like v4.3) and .z corresponds to the specific version of the XSD (e.g. 4.3.6). This version number allows for proper versioning of the subsequent versions of the XSD in the same version of the eTIR specifications.
- **Types and formats**: the data type and format of the attributes are defined in the XSD simple types using restrictions⁹. These restrictions can then be used by automated mechanisms to validate incoming messages against their corresponding XSD file.

3. The XML attributes used in the eTIR attributes

- 33. The following core data types' attributes are only shown in the detailed reports on the eTIR messages from the eTIR functional specifications and are part of the XSDs as XML attributes that characterize the eTIR attributes:
 - Date time type: the XML attribute "formatCode" is required on all date and date time XML elements. The codes are limited to 208 (CCYYMMDDHHMMSSZHHMM) and 102 (CCYYMMDD), depending on the XML elements;
 - Measure type: the XML attribute "unitCode" is required on all measurement XML elements. The codes are taken from code list 21 (measurement unit UNECE Recommendation 20) and may have restrictions depending on the XML element;
 - **Text type**: the XML attribute "languageID" is optional on all free text XML elements. The codes are taken from code list 20 (language name ISO 639-1) and in case the language identifier is not used, the text is considered to be in English.

E. Code lists

34. This section provides the technical details of all code lists used in the eTIR specifications v4.3.0. The comprehensive lists of codes for all code lists are available in the dedicated appendix, available on the eTIR web site on this page: https://www.etir.org/code-lists.

Table 14
List of code lists

Name	Type and reference if external	Version number and date of issuance
Equipment size and type description	UN/EDIFACT 8155	D.21A on 10/06/2021
Party role	UN/EDIFACT 3035	D.21A on 10/06/2021
Item type identification	UN/EDIFACT 7143	D.21A on 10/06/2021
Country name	ISO 3166-1 alpha-2	ISO 3166-1:2020
Transport means description	UNECE Recommendation 28	Revision 4.2 in 2018
Document name	UN/EDIFACT 1001	D.21A on 10/06/2021
Package type description	UNECE Recommendation 21	Revision 11 in 2020
Seal type	Internal	4.3.0 on 15/09/2021
	description Party role Item type identification Country name Transport means description Document name Package type description	description Party role UN/EDIFACT 3035 Item type identification UN/EDIFACT 7143 Country name ISO 3166-1 alpha-2 Transport means description UNECE Recommendation 28 Document name UN/EDIFACT 1001 Package type description UNECE Recommendation 21

CL29	Specifications name	Internal	4.3.0 on 15/09/2021
CL30	Specifications version	Internal	4.3.0 on 15/09/2021
CL31	Customs office role	Internal	4.3.0 on 15/09/2021
CL99	Error	Internal	4.3.0 on 15/09/2021

F. Information security threats and mitigation measures

35. The following table provides a list of common information security threats applicable to the eTIR international system, along with a set of security measures and controls put in place to mitigate the probability and/or the impact of these threats.

Table 15 **Information security threats and mitigation measures**

Threat name	Threat description	Mitigation measures
Advanced persistent threat	An advanced persistent threat (APT) is a stealthy threat actor, typically a nation state or state-sponsored group, which gains unauthorized access to a computer network and remains undetected for an extended period. In recent times, the term may also refer to non-state-sponsored groups conducting large-scale targeted intrusions for specific goals.	All measures described in the part dedicated to the Security of the eTIR system. Continuous improvement and reinforcement of the security measures and controls.
Arbitrary code execution	Arbitrary code execution (ACE) is an attacker's ability to execute arbitrary commands or code on a target machine or in a target process.	Prevent malware from being downloaded and executed on the eTIR international system using antiviruses on attached documents (in the eTIR messages).
Code injection	Code injection is the exploitation of a computer bug that is caused by processing invalid data. The injection is used by an attacker to introduce (or "inject") code into a vulnerable computer program and change the course of execution.	Multiple layers of validations applied on the eTIR messages to prevent any invalid data or authorized code injection.

Threat name	Threat description	Mitigation measures
Denial of service	A denial-of-service attack (DoS) is a cyber-attack in which the perpetrator seeks to make a server or network resource unavailable to its intended users by temporarily or indefinitely disrupting services of a host connected to the Internet.	IP whitelisting prevents all sources (except authorized ones) from accessing the web services of the eTIR international system. Functional fallback procedures reduce the impact of a lack of unavailability of the system.
Distributed Denial of Service	A distributed denial of service (DDoS) attack is a DoS attack originating from many different sources.	Same mitigation measures as for denial of service.
Network eavesdropping	Network eavesdropping is a network layer attack that focuses on capturing small packets from the network transmitted by other computers and reading the data content in search of any type of information.	Use of the latest version of the transport layer security (TLS) protocol to prevent any unauthorized disclosure of information in the exchange of eTIR messages which would result as breach of confidentiality.
Privilege escalation	Privilege escalation is the act of exploiting a bug, design flaw or configuration oversight in an operating system, or software application to gain elevated access to resources that are normally protected from an application or user. The result is that an application with more privileges than intended by the application developer or system administrator can perform unauthorized actions.	Regular patching of operating systems, middleware and libraries used in the eTIR international system. Reduced attack surface by disabling unused services and proper configuration of the ones that are used.
Ransomware	Ransomware is malware that employs encryption to hold a victim's information at ransom. A user or organization's critical data is encrypted so that they cannot access files, databases, or applications. A ransom is then demanded to provide access.	Installation of the eTIR international system in a network zone separated from the local area network (LAN). Regular backup of the storage locations to reduce the impact of a successful attack.
Social engineering	Social engineering is the psychological manipulation of people into performing actions or divulging confidential information.	Mandatory training on information security for all ECE staff members and advanced training for IT experts and staff members in charge of secured systems.
Software bugs	A software bug is an error, flaw or fault in a computer program or system that causes it to produce an incorrect or unexpected result, or to behave in unintended ways.	Preventive activities taken during the software development life cycle (SDLC) to ensure a high quality and reliability of the eTIR international system (static code analysis, automated tests coverage, continuous integration pipeline, etc.)
Unauthorized access	A person gains logical or physical access without permission to a network, system, application, data, or other resource.	Multi-layered approach to physical, network and software security. Restrict access to the servers to a limited number of ECE staff members.
Vulnerability	A vulnerability is a weakness which can be exploited by a threat actor, such as an attacker, to perform unauthorized actions within a computer system.	Use dependency checking tools to periodically assess known vulnerabilities in the software components of the eTIR international system. Regular patching of operating systems, middleware and libraries used in the eTIR international system to address known vulnerabilities.
Zero-day exploit	A zero-day exploit is an attack that uses a vulnerability that is either unknown to anyone but the attacker or known only to a limited group of people.	Removing or disabling unnecessary protocols and services to reduce the attack surface, proper configuration of network appliances (firewalls, intrusion detection system, intrusion prevention system) to prevent, detect and block potential attacks.
