

## Measuring climate change adaptation case studies: Impacts of unusual weather on the Gross Domestic Product in the Netherlands

<b>Country</b>	<b>Netherlands</b>
<b>Short description</b>	Unusual weather deviates from long-term average weather. Examples are not only cold winters and hot summers, but also heavy rainfall or (hail) storms. The frequency of unusual weather events may change in the nearby future. The GDP quarterly time series, at sector level, are normally corrected for average seasonal effects, but the impact of unusual weather on the GDP is still not clear. An ARIMA-model is used to estimate such impact. The research shows that some sectors profit from unusual weather, some don't, and some are at risk when the frequency of unusual weather increases. The obtained results are not mature. More (academic) research is needed. The results from 2014, and updated in 2020, should be seen as an inspiring first exercise.
<b>Keywords</b>	
<b>Thematic area</b>	<ul style="list-style-type: none"> <li>• Energy</li> <li>• Mining, manufacturing and construction</li> <li>• Production and consumption patterns</li> </ul>

<b>Adaptation approaches</b>	<ul style="list-style-type: none"> <li>• “Soft” adaptation – policy, legal, social, management and financial measures</li> </ul>
<b>Concepts measured</b>	<ul style="list-style-type: none"> <li>• Impacts</li> </ul>
<b>Hazard type covered</b>	<ul style="list-style-type: none"> <li>• Cold wave</li> <li>• Heatwave</li> </ul>

### Description of the statistical activity

The outputs were: [research report](#) (2014) in English and [update](#) (2020) in Dutch.

The activity is relevant in the context of climate change adaptation, since it shows that unusual weather has both positive and negative effects on economic growth (GDP). Adaptation measures should not only be focused on sectors at risk (minimizing damages), but also on sectors that profit from unusual weather (maximizing economic opportunities).

Conclusions:

- Cold weather increases heating needs (significant effect on Mining and Energy sectors)
- Severe frost hinders activities (significant effect on Construction and Manufacturing)
- Warm weather leads to a sunny ‘going out’ mood (significant effect on Accommodation and food service activities).

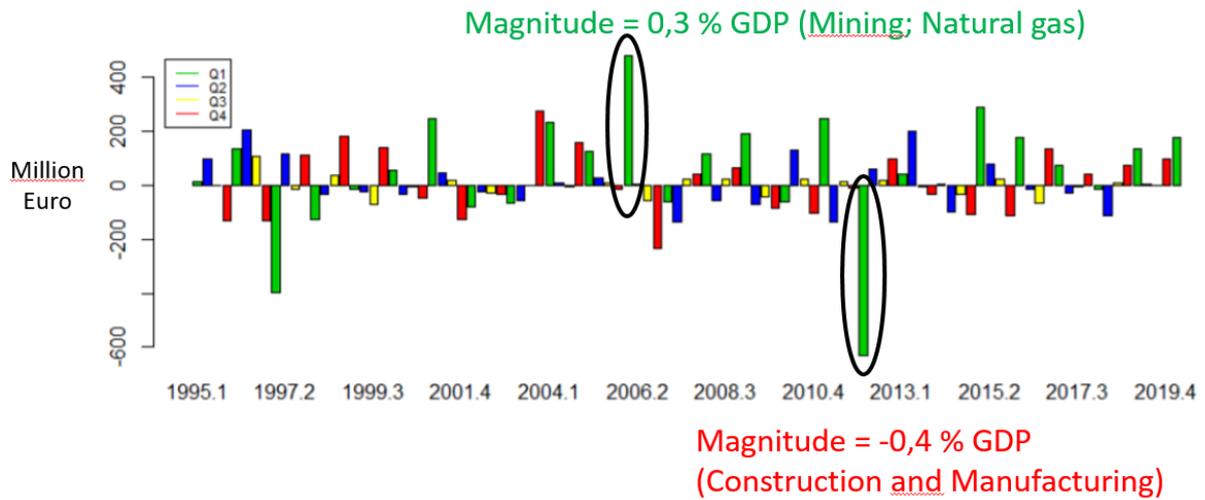

Additional research is needed. At the moment no budget is available to continue this research.

## Stakeholders and partners

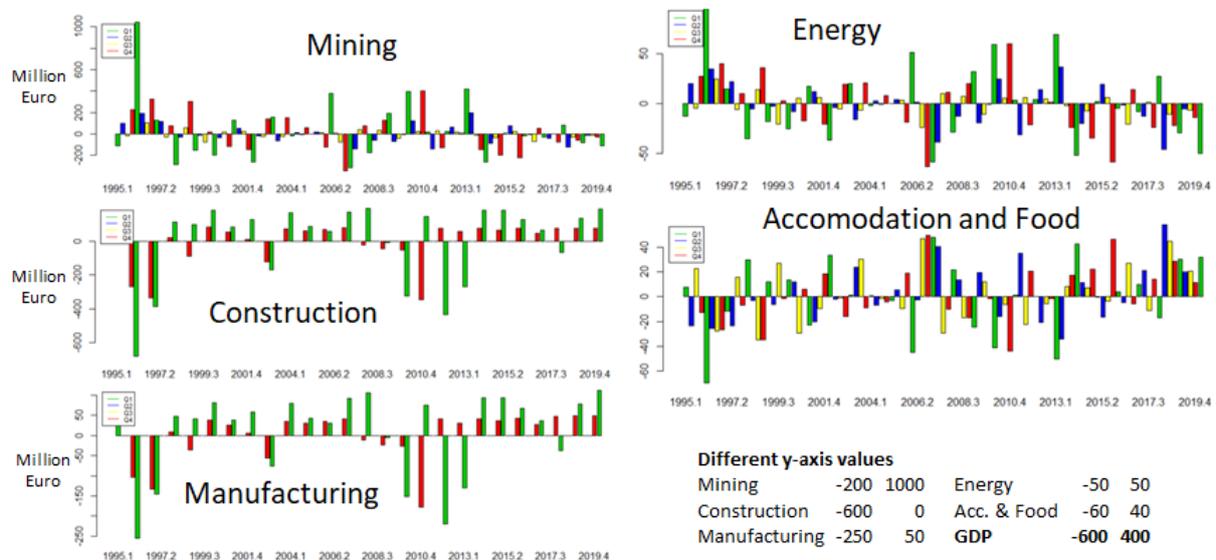

The research was done by Statistics Netherlands and financed by Ministry of Infrastructure and Water Management (as part of the National climate adaptation strategy).

## Example of outputs

### Impact of unusual weather on GDP

### Impact of unusual weather on GDP (sectors)

## More details

<b>Data sources used</b>	Daily weather indicators from Royal Netherlands Meteorological Institute (KNMI) and National Accounts data (GDP, sectors, quarterly) from Statistics Netherlands.
<b>Frequency</b>	One time activity (2014) and an update (2020).
<b>Coverage (national/subnational)</b>	National
