

### **Categories and Classes**

Codification

Classes

### **Category definitions**

E axis

- Degree of favourability of environmental social and economic conditions in establishing the viability of the project
- Includes consideration of market prices and relevant legal, regulatory, social, environmental and contractual conditions
- E1, E2 and E3 categories
- E1 is "best"
- Definitions should always be read in conjunction with supporting explanation

| Category | Definition   |  |  |  |  |
|----------|--|--|--|--|--|
| E1       | Development and operation are confirmed to be environmentally-socially-economically viable.  |  |  |  |  |
| E2       | Development and operation are expected to become environmentally-socially-economically viable in the foreseeable future.   |  |  |  |  |
| E3       | Development and operation are not expected to become environmentally-socially-economically viable in the foreseeable future or evaluation is at too early a stage to determine environmental-socio-economic viability. |  |  |  |  |

# **Category definitions**

 Maturity of technology, studies and commitments necessary to implement the project

F axis

- These projects range from early conceptual studies through to a fully developed project that is producing
- F1, F2 and F3 and F4 categories
- F1 is "best"
- Definitions should always be read in conjunction with supporting explanation

| Category | Definition  |
|----------|---|
| F1       | Technical feasibility of a development project has been confirmed.                                |
| F2       | Technical feasibility of a development project is subject to further evaluation.                  |
| F3       | Technical feasibility of a development project cannot be evaluated due to limited technical data. |
| F4       | No development project has been identified.   |

# **Category definitions**

 Degree of confidence in the estimate of the quantities of products from the project

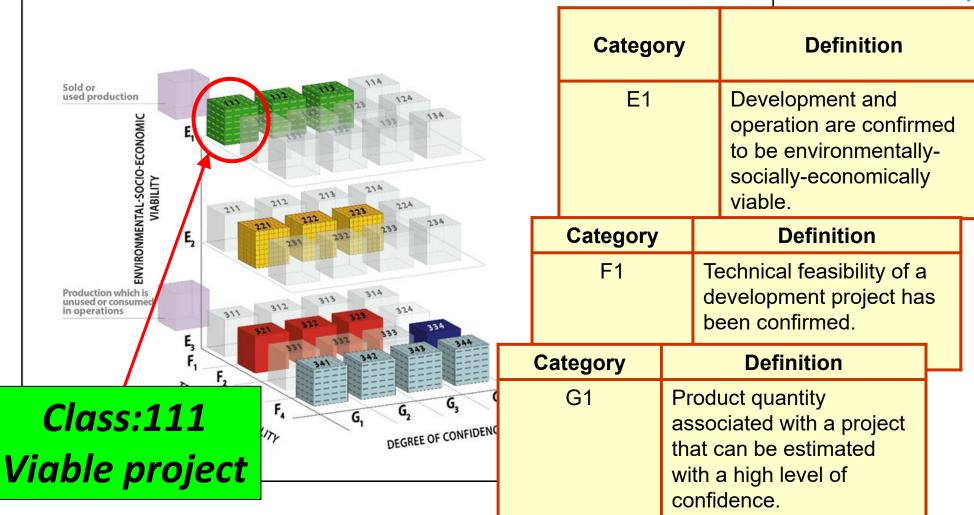

G axis

- Generally defined as discrete increments for solids (G1, G2, G3), but often defined as scenarios for fluids (G1, G1+G2, G1+G2+G3)
- G1, G2, G3 and G4 categories
- G1 is "highest confidence"
- Definitions should always be read in conjunction with supporting explanation

| Category | Definition  |  |  |  |  |
|----------|---|--|--|--|--|
| G1       | Product quantity associated with a project that can be estimated with a high level of confidence.     |  |  |  |  |
| G2       | Product quantity associated with a project that can be estimated with a moderate level of confidence. |  |  |  |  |
| G3       | Product quantity associated with a project that can be estimated with a low level of confidence.      |  |  |  |  |
| G4       | Product quantity associated with a Prospective Project, estimated primarily on indirect evidence.     |  |  |  |  |

#### How it works

**Supplementary Specifications** 

for the Application of

the United Nations Framework Classification for Resources to Minerals

Done at Geneva, 24 September 2021

# UNFC How it works

These minerals specifications are intended to support the attainment of the Sustainable Development Goals as relevant to the minerals industry.

Through their application, the collective industry will be directed towards the shared global goals.

This document incorporates the changes introduced by the recent update of UNFC (2019).

### UNFC Classes and Sub-classes defined by Sub-categories

# **Key aspects of Supplemental Specifications for Mineral Projects**

Mineral project plan and definition
Mineral project lifetime
Mineral project evaluation
Project classification
Project reporting

#### Supplemental Specifications for Mineral Projects

#### Mineral project plan and definition

#### **Mineral Project Lifetime**

- Prospecting/Exploration
- Mining
- Beneficiation / Processing
- Decommissioning
- Remediation

Project Lifetime is the remaining period of time that a project is expected to operate, constrained by technical, economic, regulatory or other permit/license cut-offs.

Mineral project lifetime is normally constrained by the period for which prospecting, exploration or mining license may apply for the project.

Mining license may include beneficiation, processing, decommissioning and remediation stages of the mineral lifecycle.

#### Supplemental Specifications for Mineral Projects

#### **Mineral project evaluation**

Mineral projects may adopt various methodologies in the various stages of the mineral lifecycle including in the estimation of quantities as appropriate to the project. The basis for any estimations shall be appropriately referenced in the evaluation. This includes not only third-party data but also methodologies or procedures that have been used by the evaluating entity to generate in-house data.

### Supplemental Specifications for Mineral Projects

#### **Project Classification**

#### Classification of projects based on the level of maturity

Where it is considered appropriate or helpful to sub-classify mineral projects to reflect different levels of project maturity, based on the current status of the project, optional sub-classes may be adopted.

#### Distinction between Environmental-Socio-Economic assumptions

The environmental-socio-economic axis categories encompass the non-technical issues that directly impact the viability of a project, including product prices, costs, legal/fiscal framework, environmental regulations and known environmental or social impediments, barriers or benefits

#### Distinction between potentially produced quantities and undeveloped quantities

Quantities of products associated with projects are categorized as F1 to F3 as potentially developable using existing technology or technology currently under development or operation. There may be remaining quantities with no development project. The product quantity associated with these are categorized as F4. These are quantities which, if produced, could be bought, sold or used.

### PERC, CRIRSCO, and UNFC: minerals reporting standards and classifications

Stephen Henley\* and Ruth Allington

There are two internationally recognised systems for classification and reporting of reserves and resources of solid minerals: the CRIRSCO family of reporting standards and the United Nations Framework Classification (UNFC). Despite a common perception that these are in competition, they are in fact closely linked, and they address different sets of requirements. The CRIRSCO standards, which include PERC, JORC. and the Canadian CIM standard among others, were developed for public reporting by companies listed on stock exchanges to provide a consistent terminology as well as quality assurance in company estimates of mineral resources and reserves. The under lying objective is protection of the public (in this case investors) by ensuring that the understood and compared, and that those who prepare public disclosure reports are competent to do so and are prepared to take personal responsibility for their own work. There are minor differences among the CRIRSCO standards as a result of differing regulatory regimes in the countries in which they are used, but all share identical care definitions and classification. The United Nations classification was developed to provide an all-inclusive system that could be used for mineral inventories and minerals policy planning by governments and comnanies alike. Where the two systems overlan. CRIRSCO provides the detailed specifications for the corresponding UNFC categories. This paper outlines the history and use of the

M ineral resources and reserves have been estimated systematically for many decades, but with expansion of the minerals industry interna-

\* Resources Computing International Ltd Matlock, United Kingdom,

Il existe deux systèmes, avec reconnaissance internationale, concernant la classification et le compte-rendu des réserves et des ressources minières : le CRIRSCO définissant les modalités de rapport et le Système de Classification des Nations Unies (UNFC). Bien que ces deux systèmes soient percus communément comme en compétition, ils sont en fait étroitement liés et répondent à des besoins différents. Les standards du CRIRSCO qui incluent entre autres les standards du PERC, du JORC et du canadien CIM ont été établis pour les rapports publics émis par les compagnies représentées à la Bourse, pour fournir une terminologie cohérente et aussi une assurance qualité ressources et réserves minières. L'objectif rapports émis utilisent une terminologie cohérente, un exposé de la réalité de telle manière qu'ils puissent être compris et comparés et que ceux en charge d'élaborer les rapports destinés au public solent compétents pour le faire et prêts personnellement à assumer leur responsabilité pour leur propre travail. Il existe quelques différences mineures dans les standards CRIRSCO provenant des différents systèmes de régulations pour les pays où elles sont utilisées mais tous les rapports partagent les mêmes définitions de fond et la même classification. L'UNFC a été créée pour fournir un système complet pouvant servir aussi bien pour un inventaire minier que pour un programme de politique minière définie par les gouvernements et les compagnies. Là où les deux systèmes se recouvrent, le CRIRSCO fournit des spécifications détaillées pour les catégories correspondantes de l'UNFC. Cet article décrit l'histoire et l'utilisation des deux systèmes

tionally, and with increasing involvement of capital markets in financing mining ventures, it became clear during the 1980s and 1990s that systematisation and regulation were needed. An early warning sign came in 1970-71 when a major nickel discovery by Poseidon in Western Australia sparked a wave of speculative company flotations,

Existen dos sistemas de clasificación y declaración de recursos minerales reconocidos internacionalmente; la familia de los códigos CRIRSCO y la Clasificación Marco de Naciones Unidas (UNFC). A pesar de que existe una cierta percepción de que ambas compiten entre ellas, en realidad están intimamente relacionadas y se refieren a una serie de requisistos diferentes. Las normas CRIRSCO, que incluven -entre otras- a las PERC, JORC y la norma canadiense CIM, se desarrollaron para la declaración pública de compañías cotizadas en las bolsas de valores, con objeto de proporcionar una terminología unificada así como el control fondo es la protección del público (en este caso los inversores) aseaurando que los y contenido nuclear congruente de modo que se puedan entender y comparar y que los autores de esos informes para el público dispuestos a asumir la responsabilidad per sonal que implica su firma. Hay pequeñas diferencias entre las normas CRIRSCO como consecuencia de los diferentes regimene regulatorios en los países en los que se utilizan, pero todas tienen las definiciones y clasificaciones fundamentales idénticas. La clasificación de Naciones Unidas se desarrolló para proporcionar un sistema alobai que se nudiera utilizar en inventarios minerales y en planes de planificación minera tanto por Gobiernos como por empresas. En aquello en que los dos sistemas se solapan. CRIRSCO proporciona las especificaciones detalladas para las categorías UNFC correspondientes. En este artículo se describe

many based upon unsubstantiated estimates of resources. A much more serious case was the Bre-X fraud in 1997, in which a Canadian company announced a gigantic gold discovery in Indonesia based on data from drill-hole core which had been 'enriched' before assaying with extra gold grains. In both cases - and in many other smaller scale

International Reporting Standards

CRIRSCO was devoloped to create a world-wide system to report Mineral resources and reserves based on a common standard and to protect the public against possible misreporting and fraud (Bre-X).

Most companies use this system for their own internal and public reporting.

Most stock exchanges and security commissions require the reports following this standard.

International Reporting Standards

#### **Use of UNFC**

UNFC provides a method for governments and NGOs to incorporate published data into databases, mineral inventories, etc.

### Use of PERC (CRIRSCO)

PERC is recognised by ESMA for use on European Union stock exchanges (ESMA = European Securities and Markets Authority)

Accepted on a number of other stock exchanges around the world (Canada, Singapore, ...)
