

Discussion Topic 3. ModernStats Models in the New Data Ecosystem

Over the years, the data ecosystem in which national statistical offices (NSOs) operate has changed dramatically. The amount of information has rapidly increased, data are being produced every second all around the world. There are more players in the data ecosystem now with data providers and users using standards different from the ones in the official statistical community.

1. What roles can ModernStats models play in the expanded data ecosystem? Do you see them as relevant for other data producers (public, private, academia)? Are they relevant for new data sources or new ways of producing data?
2. Is there any standard or model you use for your work that has potential for synergy with ModernStats models?
3. What areas of future work do you see for ModernStats models in terms of interoperability with other standards?
