Comparison of different measures of poverty in Poland (based on the results of the EU-SILC survey)

Anna Bieńkuńska
Tomasz Piasecki

Group of Experts on Measuring Poverty and Inequality,
UNECE, Geneva, 8-9 December 2022
Aim and content of the presentation

Aim
To present the results of the analysis concerning the consistency between various objective and quasi-subjective measures of poverty and the subjective assessment of the economic situation (based on the so-called Deeleck question)

Content
1. Applied poverty measures
2. Poverty versus subjective perceptions of economic situation
   - distribution of subjective assessments of 'making ends meet' among the 'poor' and 'non-poor' according to the poverty measure used
   - consistency at the microdata level
3. Main findings
4. Concluding remarks

Data source
Polish edition of the EU-SILC 2019 survey

Poverty vs subjective assessment of economic situation

Distribution of subjective assessments of 'making ends meet' among the 'poor' and 'non-poor' according to the poverty measure used
(Poland, EU-SILC 2019)

Objective poverty measures

- Extreme poverty
- Income privation
- ARPR (relative)
- SMSD (deprivation)

Subjective and objectivised subjective poverty measures

- MINQ poverty
- SPL
- Quasi LPL

Making ends meet with:
- great difficulty
- difficulty
- some difficulty
- fairly easily
- easily
- very easily
Poverty vs subjective assessment of economic situation – microdata level consistency

• Two types of inconsistency (‘misclassification’):

*False poverty* - people who are considered poor according to a specific definition of poverty, but at the same time, according to a subjective assessment, do not experience financial/ economic problems (making ends meet easily or very easily)

*Undetected poverty* - people who are not considered poor according to a specific definition of poverty, but at the same time, according to a subjective assessment, experience financial/ economic problems (making ends meet with difficulty or great difficulty).

• We analyse the incidence of these categories (‘false poor', 'undetected poor') depending on the method of measurement and the value of the poverty threshold
What do we expect?
( theoretical model)

„False poverty” rate
(share in the population of people considered poor)

„Undetected poverty” rate
(share in the population of people not considered poor)

Overall misclassification rate
(shares in the whole population)
Income poverty vs subjective assessment of economic situation
Eqivalised income, modified OECD scale (1, 0.5, 0.3)
Poland, EU-SILC 2019
Income poverty vs subjective assessment of economic situation
Eqivalised income, original OECD scale (1, 0.7, 0.5)
Poland, EU-SILC 2019

poverty threshold (eqiv. income - relative to median)
Income poverty vs subjective assessment of economic situation
Income per person in household
Poland, EU-SILC 2019
"Objectivised" subjective poverty vs subjective assessment of economic situation
Quasi LPL, utility (α) threshold
Poland, EU-SILC 2019
Non-monetary poverty vs subjective assessment of economic situation
Material and social deprivation (based on SMSD)
Poland, EU-SILC 2019

</table>

| | threshold value | misclassification rate* | threshold value | misclassification rate* |
| Quasi LPL | $\alpha = 0.25$ | 14.7% | $\alpha = 0.08$ | 13.8% |
| Material or social deprivation (SMSD related) | 7 items (at least) | 13.2% | 2 items (at least) | 7.8% |

* the sum of ‘false poverty’ and ‘undetected poverty’ (share in the whole population)
Main findings

- Among the poverty measures included in the analysis, the highest consistency with subjective assessments of economic situation was recorded for the SMSD indicator (severe material and social deprivation).

- A detailed analysis of the material and social deprivation index shows that the highest consistency with subjective assessments of the economic situation was recorded for the inability to meet 2-3 needs (rather moderate deprivation). For 4-5 items, "false poverty" is already negligible; raising the 'deprivation threshold' only increases 'undetected poverty'.

- Among the income-based poverty measures used (including 'objectivised' subjective measures), a similar picture of consistency with the subjective perception of the economic situation was observed. The rate of 'false poverty' is quite high. This is particularly surprising in the case of extreme poverty.

- 60% of the median appears to be a good threshold for relative poverty based on equivalised income (modified OECD scale) compared with the subjective perception of the economic situation (very close to the 'optimal' threshold).

- For those with very low incomes (below 0.45 median equivalised income), an increasing inconsistency was observed between income poverty and subjective assessment of economic situation (assessment of "making ends meet").

What are the potential reasons for inconsistencies between different measures of poverty and subjective assessment of economic situation?

Can the ‘indicator of subjective economic stress’ (difficulties to make ends meet) be treated as a measure of poverty? Does income poverty always indicate only those in a really bad economic situation?
Concluding remarks

- Poverty is a complex phenomenon. As a concept it is defined and understood in different ways. The choice of a particular definition of poverty and of the measurement method used determines the results of the assessment.

- The decision on how to measure poverty involves, among other things, the choice to consider poverty in an objective or in a subjective way.

- Subjective poverty measurement is not an alternative to objective poverty measurement, but should be considered as complementary. The subjective approach shows the problem of poverty from a different perspective than the objective one.

- Any known and used measure of poverty shows only selected aspects/dimensions of the phenomenon.

- The purpose of using different measures of poverty should be to enrich knowledge of the phenomenon, not to introduce 'information noise' in this regard. Each indicator has its own advantages and disadvantages and a different interpretation, which should be clearly communicated to the users of the data, including the general public.
