

Integrated system for forest damage and disturbance monitoring: The perspective of large scale bark beetle outbreak in Central Europe

Tomáš Hlásny, Czech University of Life Sciences in Prague

Assessing Forest Damage and Disturbance

Scientific-Technical Symposium jointly organized by the United Nations

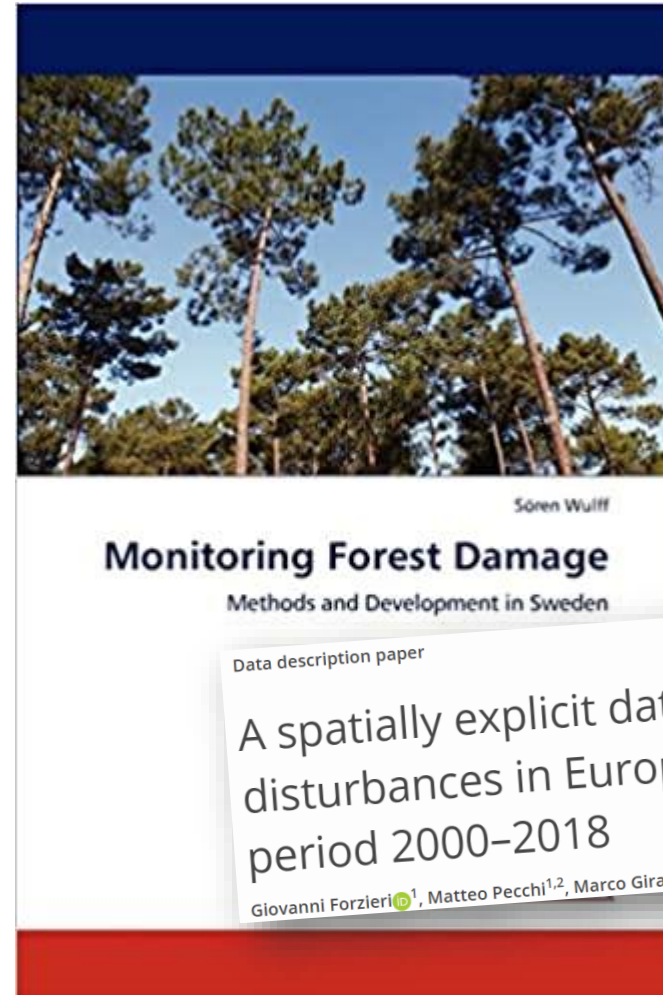

29-30 September 2022, Hosted by University of Natural Resources and Life Sciences Vienna, Austria

Disturbance / forest health monitoring

- Plot-wise: ICP Forests, NFI, targeted surveys, pheromone traps, etc.
- Areal: satellite, air-borne, and close-range remote sensing
- Other: forest owners reports, citizen science, etc.

Data description paper

A spatially explicit database of wind disturbances in European forests over the period 2000–2018

Giovanni Forzieri¹, Matteo Pecchi^{1,2}, Marco Girardello¹, Achille Mauri¹, Marcus Klaus³

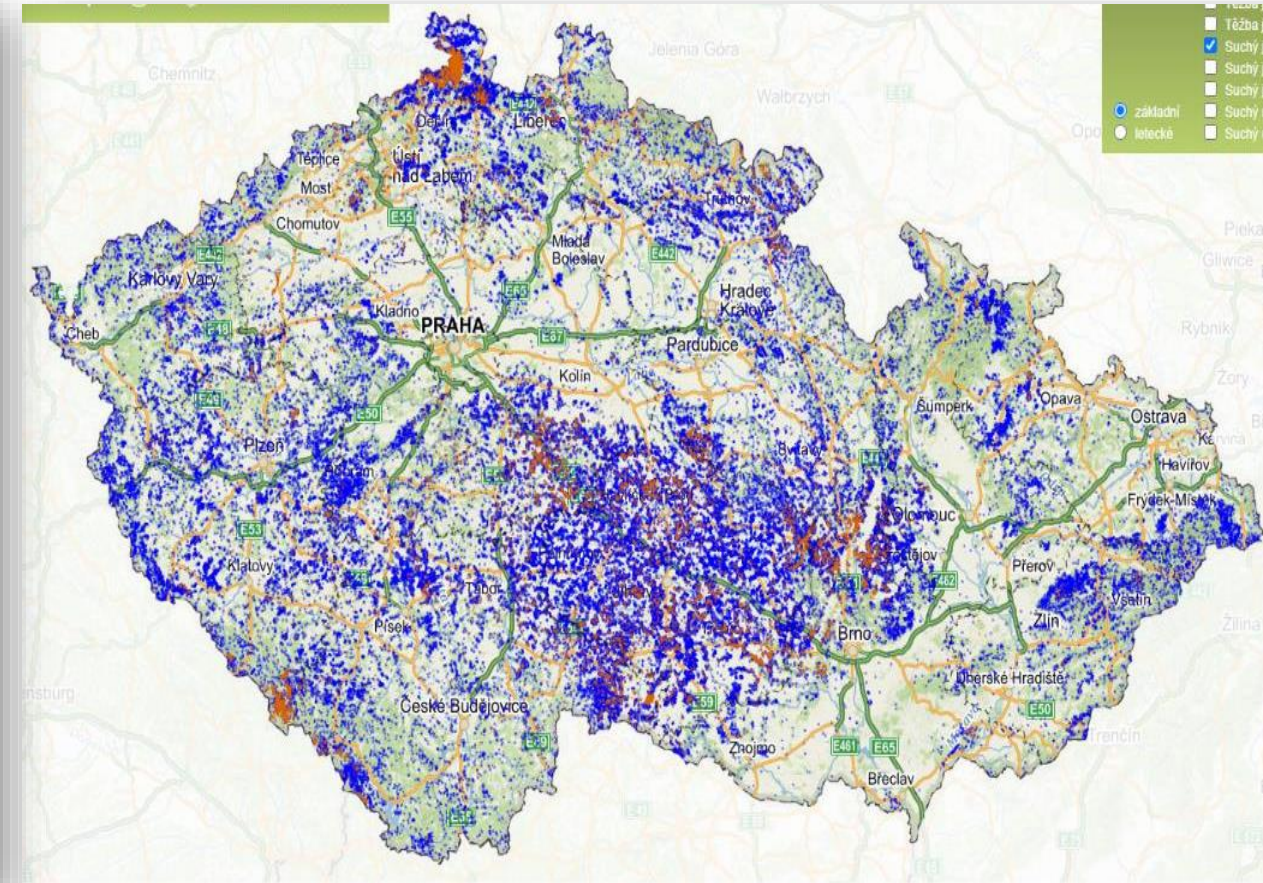

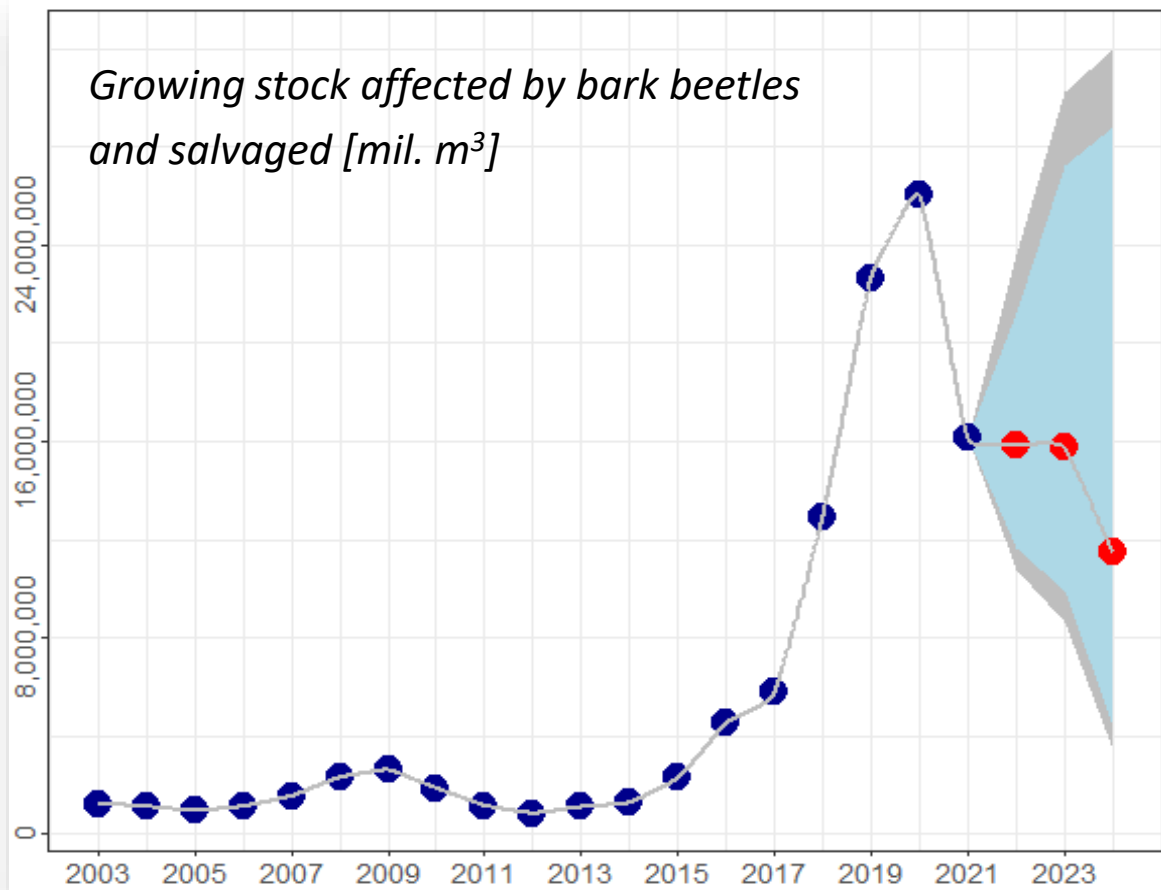

THREATS AND RESILIENCE

- How current monitoring systems perform under catastrophic events erasing hundreds of monitoring plots and tenths thousand hectares of forest per season?
- Do they just make scientists happy or can provide a real support to operational and strategic planning?

Czech Republic – an exemplar we can learn from

What do we need to know to support management responses?

- What happened and where – in terms of hectares and cubic meters of wood
- Quickly identify infestation spots and support sanitary operations
- Secure public safety
- Inform compensation and subsidy payments, plan regeneration actions
- Inform state oversight of actions taken and their compliance with the law
- Support short-term forecasts at the level of management units

Fast detection of a green-stage attack phase

Assessment of regeneration conditions

Spatially explicit changes in standing volume on annual scale

A gap between what monitoring systems produce and disturbance management needs

- Data too coarse (plot-based monitoring), too sparse in time (remote sensing), or both
- Different data availability depending on ownership
- Poor integration of partial systems and datasets
- Emerging technologies used only marginally (close range, AI)

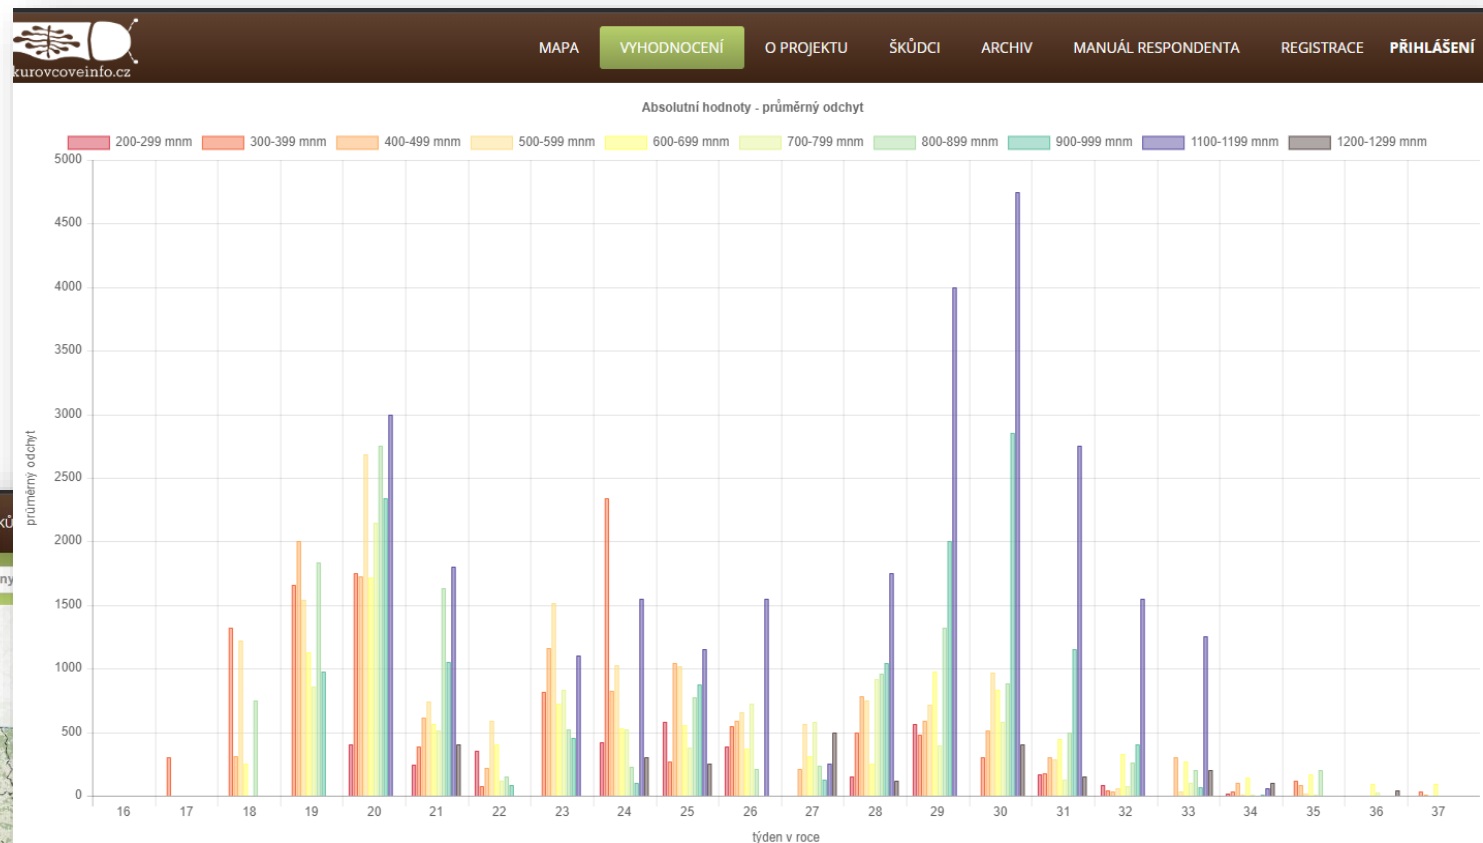

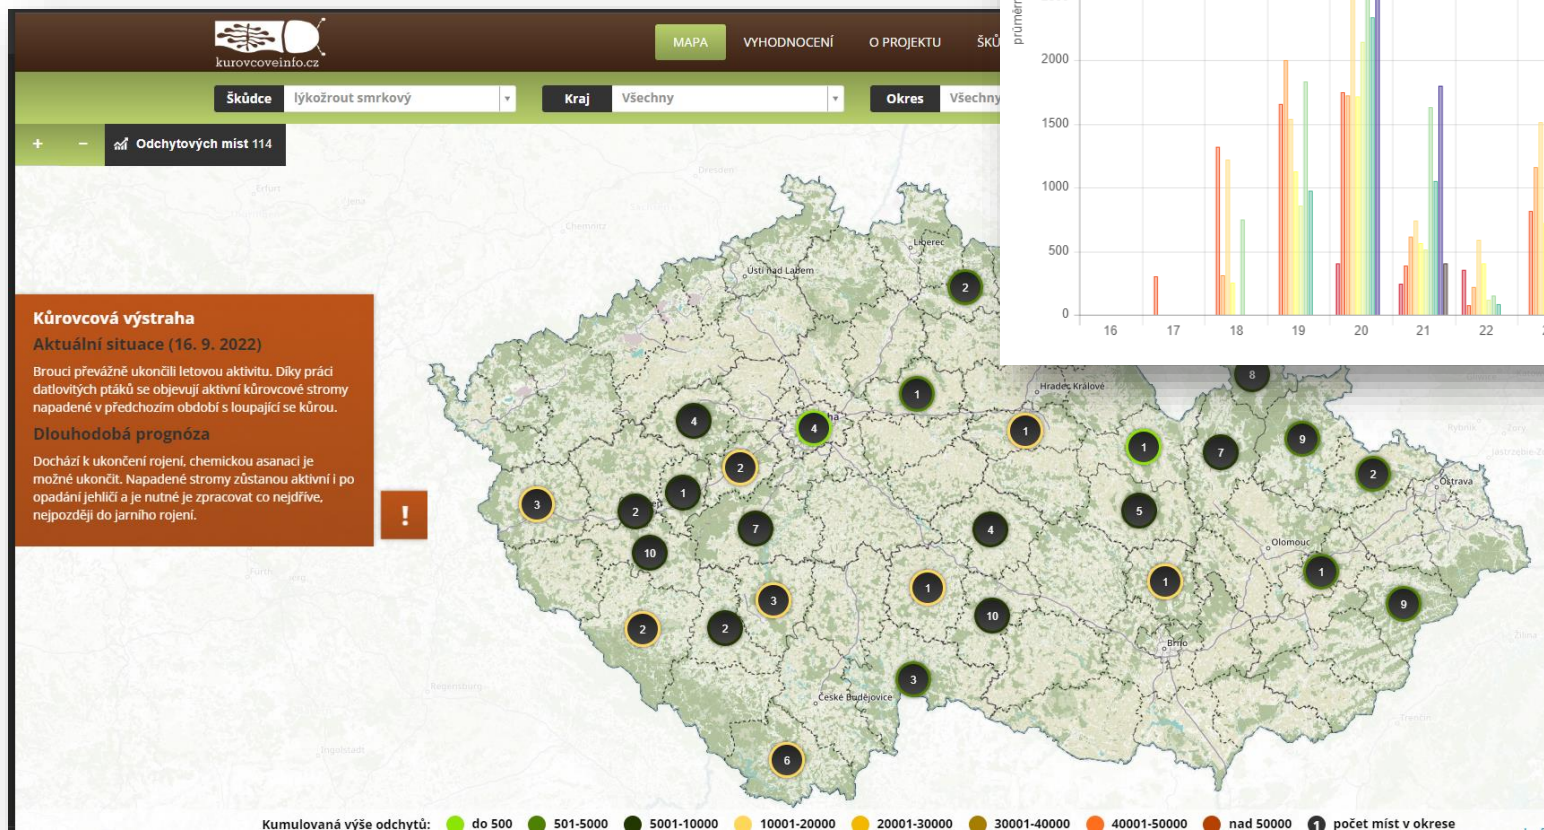

Reconnaissance flights

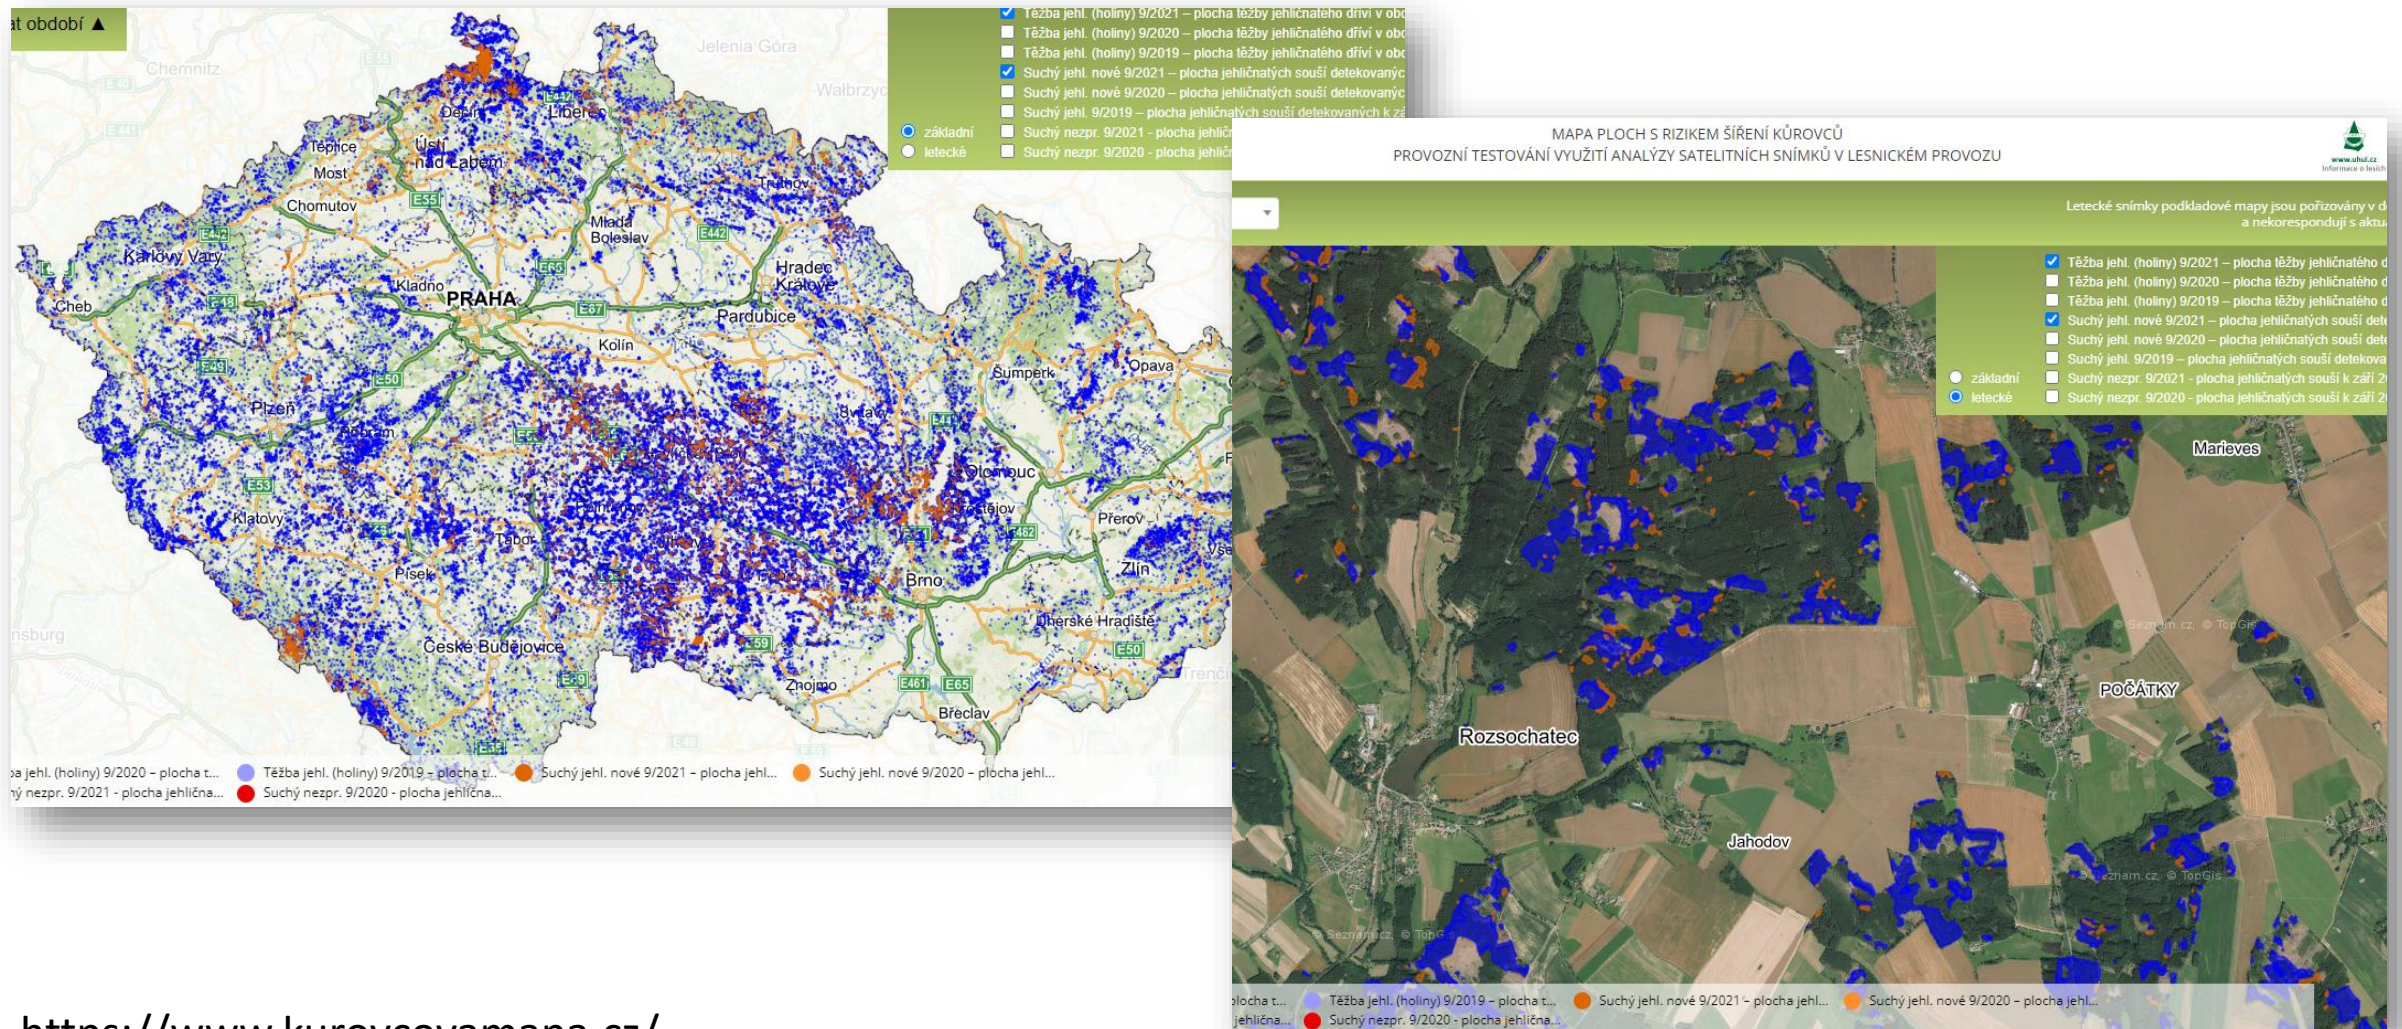

- Provided by the Ministry of Agriculture for forest owners
- Visual assessment and intervention planning
- Example: 3 hour flight, ca 40 000 ha, few people onboard

Online monitoring of beetle development

Annual satellite-based outbreak mapping

Experimental web-map application for outbreak mapping and management planning

- High-intensity visual detection of infestation spots
- Supported by trained sniffer dogs
- Real time data recording and sharing, including all interventions
- Coupled with a climate-sensitive model of bark beetle development

Ways forward

- Integrate existing systems and databases
 - Support faster uptake of emerging technologies
 - Collect and assess good practice examples
- Strengthen the dialogue between forest managers and state administration, and technology developers and manufactures
 - Define dialogue facilitator
