## Gas – Knowledge of physics and chemistry

### Examination objective 1.1: Law of ideal gases, Boyle-Mariotte – Gay-Lussac

Number	Source	Correct answer
231 01.1-01	Boyle-Mariotte law: $pV=\text{constant}$	C
	<p>A quantity of nitrogen subject to an absolute pressure of 100 kPa takes up a volume of 60 m<sup>3</sup>. At a constant temperature of 10 °C, the nitrogen is compressed to an absolute pressure of 500 kPa.</p> <p>What is the resulting volume?</p> <p>A 1 m<sup>3</sup> B 11 m<sup>3</sup> C 12 m<sup>3</sup> D 20 m<sup>3</sup></p>	
231 01.1-02	Boyle-Mariotte law: $pV=\text{constant}$	C
	<p>Some propane vapour is in a cargo tank of 250 m<sup>3</sup> at ambient temperature and at an absolute pressure of 400 kPa. Through a hole in the piping, enough propane escapes for the pressure in the cargo tank to decrease. What is the volume of the propane cloud if it does not mix with the air?</p> <p>A 250 m<sup>3</sup> B 500 m<sup>3</sup> C 750 m<sup>3</sup> D 1,000 m<sup>3</sup></p>	
231 01.1-03	Boyle-Mariotte law: $pV=\text{constant}$	B
	<p>A given quantity of nitrogen has a volume of 50 m<sup>3</sup> at an absolute pressure of 160 kPa. The nitrogen is compressed to a volume of 20 m<sup>3</sup>. The temperature remains constant. What is the resulting absolute pressure of the nitrogen?</p> <p>A 250 kPa B 400 kPa C 500 kPa D 600 kPa</p>	
231 01.1-04	Boyle-Mariotte law: $pV=\text{constant}$	A
	<p>There is nitrogen in a cargo tank of 250 m<sup>3</sup> at an absolute pressure of 220 kPa. What amount of nitrogen is required to bring the absolute pressure in the tank to 400 kPa?</p> <p>A 450 m<sup>3</sup> B 700 m<sup>3</sup> C 950 m<sup>3</sup> D 1,200 m<sup>3</sup></p>	

---

## Gas – Knowledge of physics and chemistry

### Examination objective 1.1: Law of ideal gases, Boyle-Mariotte – Gay-Lussac

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 01.1-05	Boyle-Mariotte law: $pV=\text{constant}$	B
	<p>A quantity of nitrogen takes up a volume of <math>50\text{ m}^3</math> at an absolute pressure of 320 kPa. At a constant temperature, the volume is reduced to <math>10\text{ m}^3</math>. What is the resulting absolute pressure of the nitrogen?</p> <p>A 1,100 kPa B 1,600 kPa C 2,000 kPa D 2,100 kPa</p>	
231 01.1-06	Gay-Lussac law: $p/T=\text{constant}$	C
	<p>In a closed tank, there is propane vapour at an absolute pressure of 120 kPa and at a temperature of <math>10\text{ }^\circ\text{C}</math>. With the volume of the tank remaining constant, the temperature is increased until the pressure reaches an absolute pressure of 140 kPa. What is the resulting temperature of the gas?</p> <p>A <math>12\text{ }^\circ\text{C}</math> B <math>20\text{ }^\circ\text{C}</math> C <math>57\text{ }^\circ\text{C}</math> D <math>293\text{ }^\circ\text{C}</math></p>	
231 01.1-07	Gay-Lussac law: $p/T=\text{constant}$	D
	<p>A cargo tank contains propane gas at an absolute pressure of 500 kPa at a temperature of <math>40\text{ }^\circ\text{C}</math>. If the propane gas cools to <math>9\text{ }^\circ\text{C}</math>, what is the absolute pressure in the cargo tank?</p> <p>A 100 kPa B 120 kPa C 360 kPa D 450 kPa</p>	
231 01.1-08	Gay-Lussac law: $p/T=\text{constant}$	D
	<p>A cargo tank of <math>300\text{ m}^2</math> contains nitrogen at an absolute pressure of 250 kPa at a temperature of <math>-12\text{ }^\circ\text{C}</math>. If the temperature of the nitrogen increases to <math>30\text{ }^\circ\text{C}</math>, what is the resulting absolute pressure?</p> <p>A 180 kPa B 290 kPa C 450 kPa D 750 kPa</p>	

## Gas – Knowledge of physics and chemistry

### Examination objective 1.1: Law of ideal gases, Boyle-Mariotte – Gay-Lussac

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 01.1-09	Gay-Lussac law: $p/T=\text{constant}$	C
	<p>A drum of 10 m<sup>3</sup> filled with nitrogen is under an absolute pressure of 1,000 kPa at a temperature of 100 °C. If the drum and its contents are cooled to -12 °C, what is the resulting absolute pressure?</p> <p>A 100 kPa B 600 kPa C 700 kPa D 800 kPa</p>	
231 01.1-10	Gay-Lussac law: $p/T=\text{constant}$	B
	<p>In a cargo tank, there is nitrogen at a temperature of 40 °C. The absolute pressure of 600 kPa has to be reduced to 500 kPa. The nitrogen must be cooled to what temperature?</p> <p>A To -22.6 °C B To -12.2 °C C To 33.3 °C D To 32 °C</p>	

---

## Gas – Knowledge of physics and chemistry

### Examination objective 1.2: Law of ideal gases, Fundamental laws

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 01.2-01	Fundamental law of gases: $pV/T=\text{constant}$	A
	<p>The temperature of a volume of gas of <math>40 \text{ m}^3</math> at an absolute pressure of <math>100 \text{ kPa}</math> is increased from <math>20 \text{ }^\circ\text{C}</math> to <math>50 \text{ }^\circ\text{C}</math>. If the absolute pressure increases to <math>200 \text{ kPa}</math>, what is the resulting volume?</p> <p>A <math>22 \text{ m}^3</math> B <math>29 \text{ m}^3</math> C <math>33 \text{ m}^3</math> D <math>50 \text{ m}^3</math></p>	
231 01.2-02	Fundamental law of gases: $pV/T=\text{constant}$	B
	<p>A quantity of gas takes up a volume of <math>9 \text{ m}^3</math> at an absolute pressure of <math>100 \text{ kPa}</math> and a temperature of <math>10 \text{ }^\circ\text{C}</math>. If the temperature is increased to <math>51 \text{ }^\circ\text{C}</math> and at the same time the volume is reduced to <math>1 \text{ m}^3</math>, what is the resulting absolute pressure?</p> <p>A <math>930 \text{ kPa}</math> B <math>1,030 \text{ kPa}</math> C <math>1,130 \text{ kPa}</math> D <math>2,050 \text{ kPa}</math></p>	
231 01.2-03	Fundamental law of gases: $pV/T=\text{constant}$	D
	<p>A gas takes up a volume of <math>40 \text{ m}^3</math> at a temperature of <math>50 \text{ }^\circ\text{C}</math> and at an absolute pressure of <math>200 \text{ kPa}</math>. With the temperature reduced to <math>10 \text{ }^\circ\text{C}</math>, the gas is at an absolute pressure of <math>100 \text{ kPa}</math>. What is the resulting volume?</p> <p>A <math>12 \text{ m}^3</math> B <math>16 \text{ m}^3</math> C <math>52 \text{ m}^3</math> D <math>70 \text{ m}^3</math></p>	
231 01.2-04	Fundamental law of gases: $pV/T=\text{constant}$	C
	<p>A quantity of gas takes up a volume of <math>20 \text{ m}^3</math> at a temperature of <math>50 \text{ }^\circ\text{C}</math> and at an absolute pressure of <math>200 \text{ kPa}</math>. What will the absolute pressure be if the temperature of the gas is reduced to <math>18 \text{ }^\circ\text{C}</math> and the volume is increased to <math>40 \text{ m}^3</math>?</p> <p>A <math>40 \text{ kPa}</math> B <math>60 \text{ kPa}</math> C <math>90 \text{ kPa}</math> D <math>140 \text{ kPa}</math></p>	

## Gas – Knowledge of physics and chemistry

### Examination objective 1.2: Law of ideal gases, Fundamental laws

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 01.2-05	Fundamental law of gases: $pV/T=\text{constant}$	D
	<p>A gas takes up a volume of <math>10\text{ m}^3</math> at <math>3.0\text{ }^\circ\text{C}</math> and at an absolute pressure of <math>100\text{ kPa}</math>. To what temperature must the gas be brought so that at an absolute pressure of <math>110\text{ kPa}</math> it takes up a volume of <math>11\text{ m}^3</math>?</p> <p>A <math>3.5\text{ }^\circ\text{C}</math> B <math>3.6\text{ }^\circ\text{C}</math> C <math>46\text{ }^\circ\text{C}</math> D <math>61\text{ }^\circ\text{C}</math></p>	
231 01.2-06	Fundamental law of gases: $pV/T=\text{constant}$	B
	<p>A gas takes up a volume of <math>20\text{ m}^3</math> at a temperature of <math>77\text{ }^\circ\text{C}</math> and an absolute pressure of <math>100\text{ kPa}</math>. To what temperature should the gas be cooled so that it occupies a volume of <math>8\text{ m}^3</math> at an absolute pressure of <math>200\text{ kPa}</math>?</p> <p>A <math>-63\text{ }^\circ\text{C}</math> B <math>7\text{ }^\circ\text{C}</math> C <math>46\text{ }^\circ\text{C}</math> D <math>62\text{ }^\circ\text{C}</math></p>	
231 01.2-07	Fundamental law of gases: $pV/T=\text{constant}$	A
	<p>At a temperature of <math>10\text{ }^\circ\text{C}</math> and an absolute pressure of <math>100\text{ kPa}</math>, a gas occupies a volume of <math>70\text{ m}^3</math>. What is the volume when the pressure is brought to an absolute pressure of <math>200\text{ kPa}</math> and the temperature to <math>50\text{ }^\circ\text{C}</math>?</p> <p>A <math>40\text{ m}^3</math> B <math>53\text{ m}^3</math> C <math>117\text{ m}^3</math> D <math>175\text{ m}^3</math></p>	
231 01.2-08	Fundamental law of gases: $pV/T=\text{constant}$	B
	<p>At a temperature of <math>10\text{ }^\circ\text{C}</math> and an absolute pressure of <math>100\text{ kPa}</math>, a gas takes up <math>5\text{ m}^3</math>. What is the volume when the pressure is brought to an absolute pressure of <math>200\text{ kPa}</math> and the temperature is <math>170\text{ }^\circ\text{C}</math>?</p> <p>A <math>2.0\text{ m}^3</math> B <math>3.9\text{ m}^3</math> C <math>5.3\text{ m}^3</math> D <math>42.5\text{ m}^3</math></p>	

---

## Gas – Knowledge of physics and chemistry

### Examination objective 1.2: Law of ideal gases, Fundamental laws

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 01.2-09	Fundamental law of gases: $pV/T=\text{constant}$	A
	<p>A gas takes up <math>8\text{ m}^3</math> at a temperature of <math>7\text{ }^\circ\text{C}</math> and at an absolute pressure of <math>200\text{ kPa}</math>. What is the absolute pressure when the volume is brought to <math>20\text{ m}^3</math> and the temperature to <math>77\text{ }^\circ\text{C}</math>?</p> <p>A    <math>100\text{ kPa}</math> B    <math>150\text{ kPa}</math> C    <math>880\text{ kPa}</math> D    <math>1,320\text{ kPa}</math></p>	
231 01.2-10	Fundamental law of gases: $pV/T=\text{constant}$	C
	<p>A gas takes up <math>8\text{ m}^3</math> at a temperature of <math>7\text{ }^\circ\text{C}</math> and at an absolute pressure of <math>200\text{ kPa}</math>. What should the temperature be for the gas to take up a volume of <math>20\text{ m}^3</math> at an absolute pressure of <math>100\text{ kPa}</math>?</p> <p>A    <math>9\text{ }^\circ\text{C}</math> B    <math>12\text{ }^\circ\text{C}</math> C    <math>77\text{ }^\circ\text{C}</math> D    <math>194\text{ }^\circ\text{C}</math></p>

## Knowledge of physics and chemistry

### Examination objective 2.1: Gases: partial pressures and mixtures

#### Definitions and simple calculations

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 02.1-01	Partial pressure – definitions	B
	<p>What is the definition of the partial pressure of a gas in a gas mixture contained in a cargo tank?</p> <p>A The pressure indicated on the pressure gauge</p> <p>B The pressure the gas would have if that gas alone were contained in the cargo tank</p> <p>C The volume the gas would take up if that gas alone were present in the cargo tank</p> <p>D The difference between the pressure of that gas and the atmospheric pressure</p>	
231 02.1-02	Partial pressure – definitions	C
	<p>What is the definition of the partial pressure of a gas in a gas mixture contained in a cargo tank?</p> <p>A The gauge pressure +100 kPa</p> <p>B The volume of that gas at atmospheric pressure</p> <p>C The pressure the gas would have if that gas alone were contained in the cargo tank</p> <p>D The difference between the pressure in the cargo tank and the atmospheric pressure</p>	
231 02.1-03	$p_{tot} = \sum p_i$ and $\text{Vol.-%} = p_i \times 100 / p_{tot}$	D
	<p>A cargo tank contains a mixture of nitrogen and propane. The volume per cent of nitrogen is 20 and the volume per cent of propane is 80. The total pressure in the cargo tank is 500 kPa. What is the partial pressure of the propane?</p> <p>A 20 kPa</p> <p>B 80 kPa</p> <p>C 320 kPa</p> <p>D 400 kPa</p>	
231 02.1-04	$p_{tot} = \sum p_i$ and $\text{Vol.-%} = p_i \times 100 / p_{tot}$	C
	<p>A cargo tank contains a mixture of nitrogen and propane. The nitrogen has a partial pressure of 100 kPa and its volume per cent is 20. What is the partial pressure of the propane?</p> <p>A 80 kPa</p> <p>B 320 kPa</p> <p>C 400 kPa</p> <p>D 500 kPa</p>	

---

## Knowledge of physics and chemistry

### Examination objective 2.1: Gases: partial pressures and mixtures

#### Definitions and simple calculations

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 02.1-05	$p_{tot} = \sum p_i$ and $\text{Vol.-%} = p_i \times 100 / p_{tot}$	B
	<p>A gas mixture composed of 70 volume per cent propane and 30 volume per cent butane is contained in a cargo tank at an absolute pressure of 1,000 kPa. What is the partial pressure of the butane?</p> <p>A 270 kPa B 300 kPa C 630 kPa D 700 kPa</p>	
231 02.1-06	Deleted	
231 02.1-07	$p_{tot} = \sum p_i$ and $\text{Vol.-%} = p_i \times 100 / p_{tot}$	B
	<p>A gas mixture composed of propane and butane is contained in a cargo tank at an absolute pressure of 1,000 kPa. The partial pressure of the propane is 700 kPa. What is the volume per cent of the butane?</p> <p>A 20 volume per cent B 30 volume per cent C 40 volume per cent D 60 volume per cent</p>	
231 02.1-08	$p_{tot} = \sum p_i$ and $\text{Vol.-%} = p_i \times 100 / p_{tot}$	C
	<p>A gas mixture composed of propane, butane and isobutane is contained in a cargo tank at an absolute pressure of 1,000 kPa. The partial pressures of the butane and isobutane are 200 kPa and 300 kPa, respectively. What is the volume per cent of the propane?</p> <p>A 30 volume per cent B 40 volume per cent C 50 volume per cent D 60 volume per cent</p>	
231 02.1-09	$p_{tot} = \sum p_i$ and $\text{Vol.-%} = p_i \times 100 / p_{tot}$	D
	<p>In a nitrogen/oxygen mixture at an absolute pressure of 2,000 kPa, the partial pressure of the oxygen is 100 kPa. What is the volume per cent of the nitrogen?</p> <p>A 86 volume per cent B 90 volume per cent C 90.5 volume per cent D 95 volume per cent</p>	

---

## Knowledge of physics and chemistry

### Examination objective 2.2: Gases: partial pressures and mixtures Pressure increase and gas release from cargo tanks

Number	Source	Correct answer
231 02.2-01	$p_{tot} = \sum p_i$ and Vol.-% = $p_i \times 100 / p_{tot}$ and $p * V = \text{constant}$	B
	<p>A cargo tank contains a gas mixture composed of 80 volume per cent propane and 20 volume per cent butane at an absolute pressure of 500 kPa. If, after pressure relief of the cargo tanks (gauge pressure = 0), the absolute pressure in the tank is increased to 400 kPa, what will the volume per cent of the propane be?</p> <p>A 16 volume per cent B 20 volume per cent C 25 volume per cent D 32 volume per cent</p>	
231 02.2-02	$p_{tot} = \sum p_i$ and Vol.-% = $p_i \times 100 / p_{tot}$ and $p * V = \text{constant}$	D
	<p>A cargo tank with a volume of 300 m<sup>3</sup> contains isobutane at an absolute pressure of 150 kPa. If propane that takes up 900 m<sup>3</sup> is then also compressed into the tank at an absolute pressure of 100 kPa, what will the volume per cent of the isobutane be?</p> <p>A 11.1 volume per cent B 14.3 volume per cent C 20.0 volume per cent D 33.3 volume per cent</p>	
231 02.2-03	$p_{tot} = \sum p_i$ and Vol.-% = $p_i \times 100 / p_{tot}$ and $p * V = \text{constant}$	B
	<p>A cargo tank with a volume of 100 m<sup>3</sup> contains a gas mixture composed of 50 volume per cent propane and 50 volume per cent propylene, at an absolute pressure of 600 kPa. If, at constant temperature, nitrogen that takes up 600 m<sup>3</sup> is then also compressed into the tank at an absolute pressure of 100 kPa, what will the volume per cent of the propane be?</p> <p>A 23 volume per cent B 25 volume per cent C 27 volume per cent D 30 volume per cent</p>	
231 02.2-04	$p_{tot} = \sum p_i$ and Vol.-% = $p_i \times 100 / p_{tot}$ and $p * V = \text{constant}$	D
	<p>In a cargo tank filled with air (20 volume per cent oxygen), the absolute pressure is 120 kPa. If the absolute pressure is increased, using nitrogen, to 600 kPa, what will the partial pressure of the oxygen in the cargo tank be?</p> <p>A 0.1 kPa B 4.0 kPa C 4.8 kPa D 24 kPa</p>	

---

## Knowledge of physics and chemistry

### Examination objective 2.2: Gases: partial pressures and mixtures Pressure increase and gas release from cargo tanks

Number	Source	Correct answer
231 02.2-05	$p_{tot} = \sum p_i$ and Vol.-% = $p_i \times 100 / p_{tot}$ and $p * V = \text{constant}$	A
	<p>In a cargo tank filled with nitrogen, there is an absolute pressure of 50 kPa. If an orifice is opened, and outside air containing 20 per cent oxygen enters until the absolute pressure is 100 kPa, what will the partial pressure of the oxygen in the cargo tank be?</p> <p>A 10 kPa B 20 kPa C 40 kPa D 100 kPa</p>	
231 02.2-06	$p_{tot} = \sum p_i$ and Vol.-% = $p_i \times 100 / p_{tot}$ and $p * V = \text{constant}$	C
	<p>A cargo tank contains propane at an absolute pressure of 150 kPa. If the absolute pressure in the cargo tank is increased to 600 kPa using nitrogen what will the volume per cent of the propane be?</p> <p>A 8 volume per cent B 10 volume per cent C 25 volume per cent D 30 volume per cent</p>	
231 02.2-07	$p_{tot} = \sum p_i$ and Vol.-% = $p_i \times 100 / p_{tot}$ and $p * V = \text{constant}$	C
	<p>A cargo tank with a volume of 100 m<sup>3</sup> contains propane at an absolute pressure of 150 kPa. If the absolute pressure of the cargo tank is increased with nitrogen that takes up 450 m<sup>3</sup> at an absolute pressure of 100 kPa, what will the volume per cent of the propane be?</p> <p>A 8 volume per cent B 10 volume per cent C 25 volume per cent D 30 volume per cent</p>	
231 02.2-08	Characteristics of substances	D
	<p>Which statement is correct for LNG at room temperature and ambient pressure?</p> <p>A The vapour is heavier than air B The vapour is as heavy as the air C Instead of vapour, liquid is released D The vapour is lighter than air</p>	

---

## Knowledge of physics and chemistry

### Examination objective 3.1: Avogadro's number and calculation of masses of ideal gas kmol, kg and pressure at 15 °C

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 03.1-01	1 kmol ideal gas = 24 m <sup>3</sup> at 100 kPa and 15 °C, quantity of substance = M *mass [kg]	B
	A cargo tank has a volume of 72 m <sup>3</sup> . The tank contains 12 kmol of an ideal gas at a temperature of 15 °C. What is the absolute pressure if it is assumed that 1 kmol ideal gas = 24 m <sup>3</sup> at 100 kPa and 15 °C?	
	A 300 kPa B 400 kPa C 500 kPa D 600 kPa	
231 03.1-02	1 kmol ideal gas = 24 m <sup>3</sup> at 100 kPa and 15 °C, quantity of substance = M *mass [kg]	A
	A cargo tank has a volume of 120 m <sup>3</sup> . The tank contains 10 kmol of an ideal gas at a temperature of 15 °C. What is the pressure if it is assumed that 1 kmol ideal gas = 24 m <sup>3</sup> at 100 kPa and 15 °C?	
	A 200 kPa B 400 kPa C 500 kPa D 1,200 kPa	
231 03.1-03	1 kmol ideal gas = 24 m <sup>3</sup> at 100 kPa and 15 °C, quantity of substance = M *mass [kg]	B
	A cargo tank has a volume of 120 m <sup>3</sup> . The tank contains a certain quantity of an ideal gas at a temperature of 15 °C and at an absolute pressure of 300 kPa. What is the quantity of gas if it is assumed that 1 kmol ideal gas = 24 m <sup>3</sup> at 100 kPa and 15 °C?	
	A 5 kmol B 15 kmol C 20 kmol D 30 kmol	
231 03.1-04	1 kmol ideal gas = 24 m <sup>3</sup> at 100 kPa and 15 °C, quantity of substance = M *mass [kg]	A
	In a cargo tank, there is a leakage of 120 m <sup>3</sup> of gas UN No. 1978, PROPANE (M=44) at an absolute pressure of 100 kPa and at a temperature of 15 °C. How many kg of propane gas leak into the atmosphere if it is assumed that 1 kmol ideal gas = 24 m <sup>3</sup> at 100 kPa and 15 °C?	
	A 220 kg B 440 kg C 2,880 kg D 5,280 kg	

---

## Knowledge of physics and chemistry

### Examination objective 3.1: Avogadro's number and calculation of masses of ideal gas kmol, kg and pressure at 15 °C

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 03.1-05	1 kmol ideal gas = 24 m <sup>3</sup> at 100 kPa and 15 °C, quantity of substance = M *mass [kg]	B
	<p>A cargo tank has a volume of 240 m<sup>3</sup>. How many kg of UN No. 1969, ISOBUTANE (M=58) is there in the cargo tank when the temperature is 15 °C and the absolute pressure is 200 kPa and if it is assumed that 1 kmol ideal gas = 24 m<sup>3</sup> at 100 kPa and 15 °C?</p> <p>A 580 kg B 1,160 kg C 1,740 kg D 4,640 kg</p>	
231 03.1-06	1 kmol ideal gas = 24 m <sup>3</sup> at 100 kPa and 15 °C, quantity of substance = M *mass [kg]	C
	<p>A cargo tank has a volume of 120 m<sup>3</sup>. How many kg of UN No. 1077, PROPANE (M=42) is there in the cargo tank when the temperature is 15 °C and the absolute pressure is 300 kPa and if it is assumed that 1 kmol ideal gas = 24 m<sup>3</sup> at 100 kPa and 15 °C?</p> <p>A 210 kg B 420 kg C 630 kg D 840 kg</p>	
231 03.1-07	1 kmol ideal gas = 24 m <sup>3</sup> at 100 kPa and 15 °C, quantity of substance = M *mass [kg]	B
	<p>A cargo tank has a volume of 120 m<sup>3</sup>. The tank contains 440 kg of gas UN No. 1978, PROPANE (M=44) at a temperature of 15 °C. What is the pressure if it is assumed that 1 kmol ideal gas = 24 m<sup>3</sup> at 100 kPa and 15 °C?</p> <p>A 100 kPa B 200 kPa C 1,100 kPa D 1,200 kPa</p>	

## Knowledge of physics and chemistry

### Examination objective 3.1: Avogadro's number and calculation of masses of ideal gas kmol, kg and pressure at 15 °C

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 03.1-08	1 kmol ideal gas = 24 m <sup>3</sup> at 100 kPa and 15 °C, quantity of substance = M *mass [kg]	D
	<p>A cargo tank with a volume of 100 m<sup>3</sup> contains 30 kmol of gas UN No. 1978, PROPANE at a temperature of 15 °C. What is the maximum quantity (m<sup>3</sup>) of propane gas at an absolute pressure of 100 kPa that could leak if it is assumed that 1 kmol ideal gas = 24 m<sup>3</sup> at 100 kPa and 15 °C?</p> <p>A 180 m<sup>3</sup> B 380 m<sup>3</sup> C 420 m<sup>3</sup> D 620 m<sup>3</sup></p>	
231 03.1-09	1 kmol ideal gas = 24 m <sup>3</sup> at 100 kPa and 15 °C, quantity of substance = M *mass [kg]	C
	<p>A cargo tank contains 10 kmol of an ideal gas at a temperature of 15 °C and an absolute pressure of 500 kPa. What is the volume of the cargo tank if it is assumed that 1 kmol ideal gas = 24 m<sup>3</sup> at 100 kPa and 15 °C?</p> <p>A 12 m<sup>3</sup> B 40 m<sup>3</sup> C 48 m<sup>3</sup> D 60 m<sup>3</sup></p>	
231 03.1-10	1 kmol ideal gas = 24 m <sup>3</sup> at 100 kPa and 15 °C, quantity of substance = M *mass [kg]	C
	<p>A cargo tank has a volume of 288 m<sup>3</sup>. The tank contains an ideal gas at an absolute pressure of 400 kPa. What is the quantity of gas in kmol in the cargo tank if it is assumed that 1 kmol ideal gas = 24 m<sup>3</sup> at 100 kPa and 15 °C?</p> <p>A 24 kmol B 36 kmol C 48 kmol D 60 kmol</p>

### Examination objective 6.1: Polymerization

#### Theoretical questions

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 06.1-01	Polymerization	C
	What is polymerization?	
	A A chemical reaction during which a substance burns in the air, releasing heat	
	B A chemical reaction during which a chemical bond spontaneously decomposes, producing gas	
	C A chemical reaction during which a substance's molecules bind, releasing heat	
	D A chemical reaction during which a substance reacts with water while producing heat	
231 06.1-02	Polymerization	A
	What can polymerization be triggered by?	
	A The presence of oxygen or the absence of a stabilizer	
	B Too low a pressure	
	C The presence of water in the substance subject to polymerization	
	D High-speed pumping of the substance subject to polymerization in the cargo tank	
231 06.1-03	Polymerization	B
	What is a characteristic of spontaneous polymerization?	
	A Formation of vapour	
	B Temperature increase of the liquid	
	C Temperature decrease of the liquid	
	D Falling pressure of the gaseous phase	
231 06.1-04	Polymerization	B
	What is the hazard in the event of uncontrolled polymerization of a liquid?	
	A Freezing of the level indicator float	
	B Explosion due to a significant release of heat	
	C Cracks forming in the walls of the cargo tank	
	D Depression in the cargo tanks	

---

## Knowledge of physics and chemistry

### Examination objective 6.1: Polymerization

#### Theoretical questions

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 06.1-05	Polymerization	D
	Spontaneous, uncontrolled polymerization of a liquid in a cargo tank can lead to what?	
	A Deflagration	
	B No reaction	
	C Ullage in the cargo tank	
	D Explosion due to a significant release of heat	

---

## Knowledge of physics and chemistry

### Examination objective 6.2: Polymerization Practical questions, conditions of carriage

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 06.2-01	3.2.3.2, Table C	C
	In the description “UN No. 1010, BUTADIENES (BUTADIENE-1-3), STABILIZED”, what does “STABILIZED” mean?	
	A During transport the product should not be subject to excessive shaking	
	B The product is stable in all circumstances	
	C Measures have been taken to stop polymerization during transport	
	D BUTADIENE-1-3 is a product that involves no risk	
231 06.2-02	Polymerization	C
	How can polymerization be prevented when unstabilized vinyl chloride is being transported?	
	A By loading slowly	
	B By loading the product in a pressure tank at high temperature	
	C By adding a stabilizer and/or maintaining low oxygen content in the cargo tank	
	D By adding a stabilizer when the oxygen content in the cargo tank is 20.0% volume	
231 06.2-03	Polymerization	D
	Why must a mixture of UN No. 1010, BUTADIENES (BUTADIENE-1-3), STABILIZED and other hydrocarbons be transported with a stabilizer?	
	A Because of high water concentration	
	B Because of high concentration of isobutane and butylene	
	C Because of the presence of solids	
	D Because of the high butadiene concentration	
231 06.2-04	Polymerization	A
	What is the function of a stabilizer?	
	A Prevent polymerization	
	B Interrupt polymerization by reducing temperature	
	C Exclude the possibility of a deflagration	
	D Exclude the possibility of dilation in a liquid	

---

## Knowledge of physics and chemistry

### Examination objective 6.2: Polymerization Practical questions, conditions of carriage

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 06.2-05	3.2.3.2, Table C	A
	When can a stabilized substance be transported? A When there is an entry in the transport document mentioning what stabilizer has been added and at what concentration B When the right stabilizer is on board in a sufficient quantity to be added if necessary during transport C When a sufficient quantity of stabilizer has been added immediately after loading D When the cargo is sufficiently hot to absorb the stabilizer	
231 06.2-06	3.2.3.2, Table C	D
	Certain substances must be transported in stabilized form. Where in ADN do the requirements for stabilization appear? A In section 2.2.2, Gas B In section 8.6.3, ADN checklist C In subsection 7.2.5.0, Marking D In subsection 3.2.3.2, Table C and in the explanations for this table	
231 06.2-07	Polymerization	B
	What is an indication that a substance is in the process of polymerizing? A Decrease in pressure in the cargo tank B Increase in temperature of the liquid C Decrease in temperature of the vapour D Decrease in temperature of the liquid	
231 06.2-08	Deleted (2007)	
231 06.2-09	Polymerization	C
	A sufficient concentration of stabilizer is diluted in a liquid prone to polymerization. Is the liquid then stabilized indefinitely? A Yes, as the stabilizer itself is stable B Yes, as there is no oxygen C No, as the stabilizer is always slowly consumed D No, as the stabilizer collects on the walls of the cargo tank and loses its effect

## Knowledge of physics and chemistry

### Examination objective 7.1: Evaporation and condensation Definitions, etc.

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 07.1-01	Vapour pressure	A
	The vapour pressure of a liquid is dependent on what?	
	A Temperature of the liquid	
	B Atmospheric pressure	
	C Volume of the liquid	
	D External temperature	
231 07.1-02	Vapour pressure	B
	The vapour pressure of a liquid is dependent on what?	
	A Mass of the liquid	
	B Temperature of the liquid	
	C Contents of the cargo tank	
	D Vapour/liquid ratio in the cargo tank	
231 07.1-03	Vapour pressure	C
	When does vapour condense?	
	A When the vapour pressure is higher than atmospheric pressure	
	B When the vapour pressure is lower than atmospheric pressure	
	C When the vapour pressure is higher than the vapour saturation pressure	
	D When the vapour pressure is lower than the vapour saturation pressure	
231 07.1-04	Vapour pressure	D
	What is a saturated vapour?	
	A A vapour whose temperature is identical to that of the evaporating liquid	
	B A vapour whose pressure is less than the vapour saturation pressure	
	C A vapour whose pressure is higher than the vapour saturation pressure	
	D A vapour whose pressure is equal to the vapour saturation pressure

### Examination objective 7.1: Evaporation and condensation Definitions, etc.

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 07.1-05	Vapour pressure	A
	When does a liquid evaporate?	
	A When the vapour pressure is less than the vapour saturation pressure	
	B When the vapour pressure is equal to the vapour saturation pressure	
	C When the vapour pressure is higher than the vapour saturation pressure	
	D When the vapour pressure is higher than atmospheric pressure	
231 07.1-06	Vapour pressure	B
	A cargo tank has for some time held propane vapour and a small quantity of liquid propane at the bottom of the tank. Which of the following hypotheses is correct?	
	A The vapour pressure is less than the propane vapour saturation pressure	
	B The vapour pressure is equal to the propane vapour saturation pressure	
	C The vapour pressure is higher than the propane vapour saturation pressure	
	D The vapour pressure is equal to atmospheric pressure	
231 07.1-07	Vapour pressure	C
	Vapour is drawn from a cargo tank containing liquid propane. What happens in the cargo tank once the drawing stops?	
	A The vapour pressure will decrease	
	B The vapour pressure will remain constant	
	C The vapour pressure will increase	
	D The vapour temperature will increase	
231 07.1-08	Vapour pressure	D
	With the use of a compressor, propane vapour from cargo tank No. 3 is injected into cargo tank No. 2, containing liquid propane. What will happen in cargo tank No. 2 once the compressor stops?	
	A The temperature of the liquid will decrease	
	B The vapour pressure will increase	
	C The vapour pressure will remain constant	
	D The vapour pressure will decrease	

## Knowledge of physics and chemistry

### Examination objective 7.1: Evaporation and condensation Definitions, etc.

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 07.1-09	Vapour pressure	A
	Liquid propane is pumped out of a cargo tank. What will happen in this cargo tank after the pumping stops?	
	A The vapour pressure will increase	
	B The vapour pressure will remain constant	
	C The temperature of the liquid will increase	
	D The temperature of the liquid will remain constant	
231 07.1-10	Vapour pressure	B
	Liquid propane is pumped into a cargo tank containing nitrogen at an absolute pressure of 100 kPa. What will happen to the liquid propane in this tank?	
	A The temperature of the propane will increase	
	B The temperature of the propane will decrease	
	C The temperature of the propane will remain constant	
	D The propane will solidify	
231 07.1-11	Influence on the cargo of an increase in temperature	B
	What happens when the temperature of refrigerated liquefied gas increases in the cargo tank?	
	A The level of filling of the liquid increases and the pressure drops	
	B The level of filling of the liquid and the pressure increase and may result in a “boil-off”	
	C The pressure increases and the “boil-off” condenses	
	D The pressure increases and the level of the liquid decreases	
231 07.1-12	Change in inside cargo temperature, general knowledge	B
	An insulated cargo tank is filled with LNG at a temperature of -162 °C. Which of the following has no effect on the conservation period?	
	A The heat transmission value according to 9.3.1.27.9	
	B The diameter of the gas evacuation tube	
	C The safety valve activation pressure	
	D The ambient temperature according to 9.3.1.24.2

### Examination objective 7.1: Evaporation and condensation Definitions, etc.

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 07.1-13	Characteristics of substances, 1.2.1	A
	What does the term “boil-off” mean in ADN?	
	A The gases that form due to evaporation above the surface of a cargo when its temperature increases	
	B Any temperature of a liquid above its normal boiling point	
	C The quantity of vapour that escapes through safety valves when the pressure becomes too great in a cargo tank	
	D The vapour produced when there is strong evaporation of a liquid at the beginning of loading in an empty cargo tank containing only nitrogen	
231 07.1-14	Characteristics of substances	B
	Why is it that methane cannot be liquefied at a temperature of 20 °C?	
	A The critical temperature of methane is higher than the ambient temperature	
	B The critical temperature of methane is lower than the ambient temperature	
	C The pressure would reach a too high level regardless of the cargo tank or the substance used	
	D Methane can only be liquefied at between 0 °C et -25 °C: it is then called compressed natural gas (CNG)

### Examination objective 7.2: Evaporation and condensation

#### Saturation at vapour pressure

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 07.2-01	Deleted (2007)	
231 07.2-02	Deleted (2007)	
231 07.2-03	Increase in temperature in the cargo tank	C
	<p>A cargo tank is filled to 91% with UN No. 1010, BUTADIENES (BUTADIENE-1-3), STABILIZED, at a temperature of 15 °C. The absolute pressure is 400 kPa, which is above the vapour saturation pressure. Where does this pressure come from?</p> <p>A A stabilizer</p> <p>B The fact that it takes 48 hours to reach equilibrium</p> <p>C The presence of nitrogen</p> <p>D The fact that the loading took place too slowly</p>	
231 07.2-04	Pressure in the cargo tank	D
	<p>A type G tank vessel is loaded with UN No. 1077, PROPYLENE (M=42). A quantity of 1 m<sup>3</sup> of liquid escapes from a pressure tank (d=600 kg/m<sup>3</sup>). Approximately how much propane vapour forms at ambient temperature of 20 °C?</p> <p>A 12 m<sup>3</sup></p> <p>B 24 m<sup>3</sup></p> <p>C 150 m<sup>3</sup></p> <p>D 340 m<sup>3</sup></p>	
231 07.2-05	Behaviour of pressure in the cargo tank	C
	<p>A cargo tank contains nitrogen at an absolute pressure of 100 kPa at a temperature of 5 °C. Without removing the nitrogen the absolute pressure in the cargo tank is brought to 300 kPa by adding isobutane vapour with the use of a compressor. The compressor is stopped. What happens in the cargo tank? (For information: isobutane's vapour saturation pressure at 5 °C is 186 kPa).</p> <p>A The pressure increases in the cargo tank</p> <p>B The pressure remains constant in the cargo tank</p> <p>C The pressure decreases in the cargo tank and liquid forms</p> <p>D Both the isobutane vapour and the nitrogen vapour condense</p>

## Knowledge of physics and chemistry

### Examination objective 8.2: Mixtures Hazard characteristics

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
231 08.2-01	Health risks	C
	Which of the following substances is comparable to a mixture of liquefied propane and butane gas from the point of view of health hazards?	
	A UN No. 1005, AMMONIA, ANHYDROUS	
	B UN No. 1010, BUTADIENES (BUTADIENE-1-2), STABILIZED	
	C UN No. 1879, PROPANE	
	D UN No. 1086, VINYL CHLORIDE, STABILIZED	
231 08.2-02	Health risks	B
	During transport of a mixture of liquefied gases composed of propane and butane, the same safety requirements must be followed as during transport of another gas. Which gas?	
	A UN No. 1010, BUTADIENES (BUTADIENE-1-3), STABILIZED	
	B UN No. 1969, ISOBUTANE	
	C UN No. 1280, PROPYLENE OXIDE	
	D UN No. 1086, VINYL CHLORIDE, STABILIZED	
231 08.2-03	Health risks	B
	Which of the following substances is comparable to UN No. 1965, HYDROCARBON GAS MIXTURE, LIQUEFIED, N.O.S. (MIXTURE A) from the point of view of health hazards?	
	A UN No. 1010, BUTADIENES (BUTADIENE-1-3), STABILIZED	
	B UN No. 1969, ISOBUTANE	
	C UN No. 1280, PROPYLENE OXIDE	
	D UN No. 1086, VINYL CHLORIDE, STABILIZED	
231 08.2-04	Health risks	C
	During transport of UN No. 1965, HYDROCARBON GAS MIXTURE, LIQUEFIED, N.O.S. (MIXTURE A), the same safety requirements must be followed as during transport of another gas. Which gas?	
	A UN No. 1005, AMMONIA, ANHYDROUS	
	B UN No. 1010, BUTADIENES (BUTADIENE-1-2), STABILIZED	
	C UN No. 1969, ISOBUTANE	
	D UN No. 1280, PROPYLENE OXIDE

### Examination objective 1.3: Flushing

#### Methods for flushing (degassing) before entering cargo tanks

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 01.3-01	Methods for flushing (degassing)	D
	<p>A cargo tank contains propane vapour, with no liquid, and is relieved of pressure. Which of the following methods for flushing under pressure with nitrogen results in the lowest final concentration?</p> <p>A Setting the absolute pressure to 800 kPa once, then releasing the pressure</p> <p>B Setting the absolute pressure to 400 kPa twice, then releasing the pressure</p> <p>C Setting the absolute pressure to 300 kPa three times, then releasing the pressure</p> <p>D Setting the absolute pressure to 200 kPa five times, then releasing the pressure</p>	
232 01.3-02	Methods for flushing (degassing)	D
	<p>A cargo tank contains propane vapour, with no liquid, and the cargo tank is relieved of pressure. A propane concentration of less than 0.5% volume should be obtained. Which of the following methods for flushing uses the least nitrogen?</p> <p>A Setting the absolute pressure to 600 kPa three times, then releasing the pressure</p> <p>B Setting the absolute pressure to 400 kPa four times, then releasing the pressure</p> <p>C Setting the absolute pressure to 300 kPa five times, then releasing the pressure</p> <p>D Setting the absolute pressure to 200 kPa eight times, then releasing the pressure</p>	
232 01.3-03	Methods for flushing (degassing)	C
	<p>What does longitudinal flushing mean?</p> <p>A Raising the pressure in a cargo tank, then releasing the pressure</p> <p>B Simultaneously raising the pressure in several cargo tanks with nitrogen</p> <p>C Continually adding nitrogen to the cargo tank(s) and simultaneously releasing the overpressure</p> <p>D Simultaneously raising the pressure with nitrogen in the port and starboard cargo tanks</p>	

---

## Practice

### Examination objective 1.3: Flushing

#### Methods for flushing (degassing) before entering cargo tanks

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 01.3-04	Methods for flushing (degassing)	A
	What does flushing under pressure mean?	
	A A repeated raising of pressure in one or more cargo tanks with nitrogen, followed by a release of pressure	
	B An uninterrupted flow of nitrogen through several cargo tanks in a line	
	C An interrupted flow of nitrogen through a cargo tank	
	D An interrupted flow of nitrogen at high pressure through one or more cargo tanks	
232 01.3-05	Flushing (degassing) at the same time as repairs	B
	A vessel has just transported propane and has to go to the yard for repairs to the cargo tanks. With what do the cargo tanks have to be flushed?	
	A With nitrogen only	
	B First with nitrogen and then with air	
	C With air only	
	D No flushing is necessary	
232 01.3-06	Flushing (degassing) in connection with repair work	C
	A vessel has previously carried propane and is headed for the shipyard for soldering work on its cargo tanks. With what must the cargo tanks and piping be flushed?	
	A No flushing is required	
	B First with air and then with nitrogen	
	C First with nitrogen and then with air	
	D Only with nitrogen	
232 01.3-07	7.2.3.1.6	B
	A vessel has carried butane. Empty cargo tanks are to be entered without a self-contained breathing apparatus. How should the cargo tanks be flushed?	
	A With nitrogen until the concentration of butane is no more than 1% volume	
	B First with nitrogen, then with air until the oxygen content is between 20 and 23.5% volume	
	C First with nitrogen, then with air, until the oxygen content reaches 16% volume	
	D Directly with air until the oxygen content reaches 20% volume	

## Practice

### Examination objective 1.3: Flushing

#### Methods for flushing (degassing) before entering cargo tanks

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 01.3-08	Longitudinal flushing	C
	Why is longitudinal flushing an efficient method for flushing cargo tanks?	
	A Because with a relatively weak flow of nitrogen, the heavier gas of the chemical to be vented is completely flushed out by the nitrogen and only a volume of nitrogen equal to the volume of the tank is thus used	
	B Because with a relatively large flow of nitrogen, the gas and the nitrogen are completely mixed so that a considerable quantity of nitrogen is used, but the task is quickly done	
	C Because the substituting of the gas with nitrogen in the initial stage and the mixing of the two gases in the final stage means less nitrogen is used than when flushing under pressure	
	D Because it allows for advance calculation of the final concentration in the cargo tank of the gas to be vented, after a specific time period	
232 01.3-09	Deleted (2007)	

---

## Practice

### Examination objective 2: Sampling

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 02.0-01	Deleted (2010)	
232 02.0-02	Deleted (2010)	
232 02.0-03	Flushing/rinsing of test tubes	D
	What should be done with a test tube before a representative sample of liquid may be taken?	
	A The test tube should be rinsed with water	
	B The test tube should be flushed with dry air	
	C The test tube should be flushed 10 times with gas then plunged into water	
	D The test tube should be rinsed with the liquid to be sampled	
232 02.0-04	Flushing/rinsing of test tubes	A
	What should be done with a test tube before a representative sample may be taken of the gaseous phase?	
	A The test tube should be flushed with the gas to be sampled	
	B The test tube should first be filled with the liquid form of the chemical	
	C The test tube should be rinsed with a liquid	
	D The test tube should be rinsed with water	
232 02.0-05	Sampling during longitudinal flushing	C
	A tank vessel was previously loaded with UN No. 1011 BUTANE. The cargo tanks are empty and have not been cleaned. They are flushed using the longitudinal flushing method. Where is the highest concentration of butane measured during the flushing?	
	A High up in the cargo tank	
	B Halfway up the cargo tank	
	C At the bottom of the cargo tank	
	D In the gas piping	
232 02.0-06	Deleted (2007)	
232 02.0-07	7.2.4.1.1 Storage of samples in test tubes	A
	Where should a test tube used to sample a liquid be stored?	
	A In a protected location above deck in the cargo area	
	B In a cool location outside the cargo area	
	C In a cofferdam	
	D In the wheelhouse

### Examination objective 3: Dangers of explosion

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 03.0-01	Definition of explosive limit	A
	<p>The concentration of gases in a mixture composed of flammable gas and air is below the lower explosive limit. What are the properties of this mixture?</p> <p>A It cannot ignite</p> <p>B It can burn, but not explode</p> <p>C It can explode but not burn</p> <p>D It can burn or explode</p>	
232 03.0-02	Definition of explosive limit	C
	<p>The concentration of gases in a mixture composed of flammable gas and air is higher than the upper explosive limit. What are the properties of this mixture?</p> <p>A It cannot burn</p> <p>B It cannot condense</p> <p>C With the addition of air an explosive mixture can be formed</p> <p>D It can explode</p>	
232 03.0-03	Definition of explosive limit	D
	<p>A mixture of gases is composed of 6 volume per cent propane, 4 volume per cent oxygen and 90 volume per cent nitrogen. How explosive is this mixture considered to be?</p> <p>A Explosive, since the concentration of propane is above the lower explosive limit</p> <p>B Explosive, since the concentration of propane is higher than the upper explosive limit</p> <p>C Non-explosive, since the concentration of propane is below the lower explosive limit</p> <p>D Non-explosive, since the concentration of oxygen is too weak to ignite the mixture</p>	
232 03.0-04	Definition of explosive limit	D
	<p>The atmosphere in a cargo tank contains 100 volume per cent nitrogen. What forms in the cargo tank when it is loaded with isobutane?</p> <p>A A flammable mixture which could explode</p> <p>B An explosive mixture, since the oxygen content is sufficiently high</p> <p>C An explosive mixture</p> <p>D A mixture that is not explosive</p>	

## Practice

### Examination objective 3: Dangers of explosion

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 03.0-05	Definition of explosive limit	A
<p>A mixture of gases is composed of 10 volume per cent propylene, 18 volume per cent oxygen and 72 volume per cent nitrogen. How explosive is this mixture considered to be?</p>		
A Explosive, since the concentration of propylene is within the explosive range and the concentration of oxygen is sufficiently high		
B Explosive, since the concentration of propylene is above the upper explosive limit		
C Non-explosive, since the concentration of oxygen is less than 21 volume per cent		
D Non-explosive, since the concentration of propylene is below the lower explosive limit		
232 03.0-06	Critical dilution rate	B
<p>A cargo tank contains a mixture of gases composed of 5 volume per cent propane, 5 volume per cent oxygen and 90 volume per cent nitrogen. Should this cargo tank be flushed with air?</p>		
A Yes, since the concentration of propane is outside the explosive range		
B No, since the concentration of oxygen will increase and the mixture will become explosive		
C Yes, since the oxygen content in the cargo tank is less than 10 volume per cent		
D Yes, since there is sufficient nitrogen in the cargo tank		
232 03.0-07	Critical dilution rate	C
<p>A cargo tank contains a mixture of gases composed of nitrogen, oxygen and n-butane, with 3 volume per cent oxygen and less than 2 volume per cent n-butane. Should this cargo tank be flushed with air?</p>		
A No, since the concentration of butane is within the explosive range		
B No, since, when diluted with air, the concentration of oxygen will increase and the mixture will become explosive		
C Yes, since the concentrations of butane and oxygen are so low that if diluted with air, a non-explosive mixture is formed		
D Yes, since the concentration of butane is below the lower explosive limit		

---

## Practice

### Examination objective 3: Dangers of explosion

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 03.0-08	Risk of explosion	B
	<p>Propane gas is under pressure in a closed system. The propane escapes through a small leak to the outside. What will happen to the propane gas?</p> <p>A It will spontaneously combust</p> <p>B It will mix with the air and form an explosive mixture</p> <p>C Being a heavy gas, a high concentration will remain near the source</p> <p>D It will not mix with the air but will rise unmixed</p>	
232 03.0-09	Explosive limit and static electricity	D
	<p>An area contains air with 5 volume per cent propane gas. A spark occurs as a result of a discharge of static electricity. Will the spark cause the propane/air mixture to ignite?</p> <p>A No, since the ignition energy of the spark is definitely too weak</p> <p>B No, since the concentration of propane is too low</p> <p>C No, since the concentration of propane is too high</p> <p>D Yes, since the concentration of propane is within the explosive range</p>

### Examination objective 4: Health risks

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 04.0-01	Imminent hazards	A
	Which of the following substances is toxic and corrosive and poses an imminent inhalation hazard? A UN No. 1005, AMMONIA, ANHYDROUS B UN No. 1010, BUTADIENES (BUTADIENE-1-2), STABILIZED C UN No. 1969, ISOBUTANE D UN No. 1978, PROPANE	
232 04.0-02	Delayed effect	B
	Which of the following substances is carcinogenic? A UN No. 1005, AMMONIA, ANHYDROUS B UN No. 1010, BUTADIENES (BUTADIENE-1-3), STABILIZED C UN No. 1962, ETHYLENE D UN No. 1969, ISOBUTANE	
232 04.0-03	Anaesthetizing effect	D
	Which of the following gases has an immediate effect via inhalation on the central nervous system and an anaesthetizing effect with prolonged exposure or at a high concentration? A UN No. 1011, BUTANE B UN No. 1969, ISOBUTANE C UN No. 1077, PROPYLENE D UN No. 1086, VINYL CHLORIDE, STABILIZED	
232 04.0-04	Definition of the maximum workplace concentration	C
	What is meant by the maximum workplace concentration of a substance? A The maximum acceptable concentration for an unspecified period of exposure B The maximum acceptable concentration to safeguard health C The maximum permissible concentration of the substance in air at which even an exposure of 8 hours per day and a maximum of 40 hours per week does not have adverse effects on health D The acceptable average minimum concentration of the substance in air	

---

## Practice

### Examination objective 4: Health risks

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 04.0-05	Definition of the maximum workplace concentration	C
	What is meant by the maximum workplace concentration of a substance? A The average maximum acceptable gas concentration over time of the substance in air for 15 minutes and for not more than 8 hours per day B The average maximum acceptable gas concentration over time of the substance in air for one hour and not more than eight hours per day C The maximum permissible concentration of the substance in air at which exposure for 8 hours per day and a maximum of 40 hours per week does not have adverse effects on health D The average maximum acceptable concentration over time of the substance in air for one hour and not more than eight hours per week	
232 04.0-06	Exceeding the maximum workplace concentration	B
	A substance has a maximum workplace concentration of 1 ppm. What is the maximum amount of time a person can remain in an area where the concentration of the substance is 150 ppm? A One minute B The area should not be entered C One hour D Eight hours	
232 04.0-07	Maximum workplace concentration – odour threshold	A
	A substance has a maximum workplace concentration of 100 ppm and an odour threshold of 200 ppm. If the substance's odour cannot be detected in an area, what can be concluded with regard to health risks? A It could be hazardous, since the maximum workplace concentration may be exceeded B There is no risk, since the concentration is less than the maximum workplace concentration C There is no risk, since the concentration is higher than 200 ppm D It is hazardous, since the concentration is higher than 200 ppm

Is a person allowed to enter the hold space without any protective equipment to carry out a check?</p> <p>A Yes, this is allowed during loading once it is ascertained that the provisions of 7.2.3.1.6 have been followed</p> <p>B No, only with the agreement of the competent authority</p> <p>C No, only with the agreement of the person responsible for trans-shipment at the shore installation</p> <p>D No, only with a gas free certificate</p>		
232 07.0-08	8.3.5	A
<p>A tank vessel is moored at a shore installation and is in an onshore assigned explosion protection zone. Is it permitted to carry out some minor repairs liable to produce sparks in the accommodation?</p> <p>A No, only with the agreement of the competent authority</p> <p>B Yes, provided the accommodation doors and other openings are closed</p> <p>C Yes, provided during the work the gas concentration is regularly measured on site</p> <p>D Yes, provided you have the agreement of the shore facility</p>		

## Practice

### Examination objective 7: Certificates for degassing and permitted work

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 07.0-09	8.3.5	C
<p>A tank vessel is loaded with UN No. 1011, BUTANE. Is it permitted to carry out some minor repairs likely to produce sparks in the engine room during the journey?</p>		
<p>A Yes, as it is minor work outside the cargo area. Such work can be carried out without any other measures</p>		
<p>B Yes, provided during the work the gas concentration is regularly measured on site</p>		
<p>C Yes, provided the engine room doors and other openings are closed</p>		
<p>D No, it is not allowed without the agreement of the competent authority</p>		
232 07.0-10	8.3.5	D
<p>A tank vessel is being loaded with UN No. 1280, PROPYLENE OXIDE. Is it permitted to carry out some minor welding work in the accommodation?</p>		
<p>A Yes, as it is minor work outside of the cargo area</p>		
<p>B Yes, provided during the welding work the gas concentration is regularly measured on site</p>		
<p>C Yes, with the agreement of the shore installation</p>		
<p>D No</p>		

---

## Practice

### Examination objective 8: Degree of filling and over-filling

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 08.0-01	1.2.1	C
	<p>To what temperature is the maximum permissible degree of filling of cargo tanks set out in ADN applicable?</p> <p>A 15 °C</p> <p>B 20 °C</p> <p>C The temperature during loading</p> <p>D The highest temperature likely to be encountered during transport</p>	
232 08.0-02	Degree of filling	D
	<p>Propane from shore tank A must be loaded into cargo tanks 1, 3 and 6 and propane from shore tank B must be loaded into cargo tanks 2, 4 and 5. The temperatures in the cargo tanks are not the same. What is the maximum degree of filling that must be observed?</p> <p>A A single degree of filling for all the cargo tanks, corresponding to the average temperature of the propane</p> <p>B A single degree of filling for all the cargo tanks, corresponding to the lowest temperature of the propane</p> <p>C A single degree of filling for all the cargo tanks, corresponding to the highest temperature of the propane</p> <p>D 91% for each cargo tank</p>	
232 08.0-03	Degree of filling	C
	<p>Why should a certain degree of filling of a cargo tank not be exceeded?</p> <p>A Because the vessel would be overloaded</p> <p>B To avoid “waves” in the cargo tanks and thus avoid damaging the tanks</p> <p>C To prevent the safety valve from opening if it heats up</p> <p>D To ensure the stability of the vessel</p>	
232 08.0-04	Degree of filling	A
	<p>UN No. 1978, PROPANE is loaded at a temperature over 15 °C. Up to what filling level is it possible to load?</p> <p>A 91%</p> <p>B More than 91%</p> <p>C Less than 91%</p> <p>D 95%</p>	

## Practice

### Examination objective 8: Degree of filling and over-filling

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 08.0-05	Degree of filling	B
	<p>What correction has to be applied to determine the permissible degree of filling?</p> <p>A Content correction</p> <p>B Trim correction</p> <p>C Pressure correction</p> <p>D Vapour pressure correction</p>	
232 08.0-06	Degree of filling	A
	<p>What correction sometimes has to be applied to determine the permissible degree of filling?</p> <p>A Density correction</p> <p>B Content correction</p> <p>C Pressure correction</p> <p>D Vapour pressure correction</p>	
232 08.0-07	Overfilling	C
	<p>What risk is there in the event of overfilling?</p> <p>A That the vessel's load is not balanced</p> <p>B That the vessel is overloaded</p> <p>C That the cargo may leak</p> <p>D That there may be a backflow into the cargo tank</p>	
232 08.0-08	9.3.1.21.1	D
	<p>According to ADN, what degree of filling should actuate the automatic high-level sensor against overfilling?</p> <p>A 86% maximum</p> <p>B 91% maximum</p> <p>C 95% maximum</p> <p>D 97.5% maximum</p>	
232 08.0-09	9.3.1.21.1	A
	<p>According to ADN, what degree of filling should actuate the level alarm device?</p> <p>A 86%</p> <p>B 91%</p> <p>C 95%</p> <p>D 97.5%</p>	

---

## Practice

### Examination objective 8: Degree of filling and over-filling

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 08.0-10	Degree of filling	B
	What should be done when the level device is activated?	
	A Immediately stop the loading	
	B If necessary, reduce the flow of loading	
	C Activate the quick closing valve	
	D Transfer some of the product into another cargo tank	
232 08.0-11	7.2.4.16.16	B
	Why must the holding time be calculated during the transport of refrigerated liquefied gas without temperature control?	
	A To check whether the maximum filling level of the cargo tank has been exceeded	
	B To check whether the intended journey can be made safely and without the release of material	
	C To check which substance can be transported	
	D To check whether the safety valve pressure is set sufficiently high	
232 08.0-12	7.2.4.16.17	A
	What parameters must be taken into account when calculating the holding time during the transport of refrigerated liquefied gas?	
	A The heat transfer value, the activation pressure of the safety valves, the temperature of the cargo, the degree of filling of the cargo tanks and the ambient temperature	
	B The activation pressure of the safety valves, the temperature of the cargo, the degree of filling of the cargo tanks and the temperature of the cargo tanks	
	C The heat transfer value, the activation pressure for the safety valves, the temperature of the cargo and the degree of filling of the cargo tanks	
	D The heat transfer value, the activation pressure of the safety valves, the degree of filling of the cargo tanks, the ambient temperature and the temperature of the cargo tanks	
232 08.0-13	7.2.4.16.17	C
	The expected duration of the journey of a vessel transporting refrigerated liquefied gas is 14 days. What must the holding time be?	
	A 12 days	
	B 28 days	
	C 38 days	
	D 42 days	

---

## Practice

### Examination objective 9: Safety installations

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 09.0-01	Safety against bursts in the piping	A
	What is the function of a safety device against bursts in the piping?	
	A Prevent leaks of large quantities of product in the event of a burst in the piping	
	B Limit the load flow	
	C Prevent depression in the cargo tanks	
	D Prevent excessive pressure build-up in the cargo tanks	
232 09.0-02	Safety against bursts in the piping	C
	Where are safety devices against bursts in the piping placed?	
	A In the piping under pressure, near the pump	
	B In the suction pipes, near the pump	
	C In the cargo tank, in the pipes for loading and unloading	
	D On the deck, in the loading and unloading piping	
232 09.0-03	Safety against bursts in the piping	D
	What is a device against bursts in the piping?	
	A A remote-controlled valve that can be closed if needed	
	B A valve with a hand-operated control that can be closed in an emergency	
	C A narrow section in the line to limit the flow	
	D A self-closing stop-valve requiring no command	
232 09.0-04	Safety against bursts in the piping	B
	When must a device against bursts in the piping be activated?	
	A When the flow speed is lower than the calculated speed	
	B When the flow speed is greater than the calculated speed	
	C When a rapid blocking valve has been installed before the device against bursts in the piping	
	D When a narrow section has been installed before the device against bursts in the piping	

---

## Practice

### Examination objective 9: Safety installations

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 09.0-05	Safety against bursts in the piping	A
	<p>The device against bursts in the piping is a spring valve set into the piping. When must the valve close on its own?</p> <p>A When the flow speed is so high that the depression over the valve exceeds the tensile force of the spring</p> <p>B When the flow speed is so high that the depression over the valve is less than the tensile force of the spring</p> <p>C When the flow speed is so high that the depression before the valve exceeds the depression corresponding to the tensile force of the spring</p> <p>D When the flow speed is so high that the over pressurization behind the valve exceeds the depression corresponding to the tensile force of the spring</p>	
232 09.0-06	9.3.1.21.9	A
	<p>During loading and unloading the quick closing valves must be able to be closed by a switch so that, in an emergency, the loading or unloading can be stopped. Where must these switches be located?</p> <p>A At two locations on the vessel (fore and aft) and at two locations on shore</p> <p>B At the shore installation and at the shore connection of the pipes for loading and unloading</p> <p>C In the wheelhouse, at the shore connection of the pipes for loading and unloading and at the shore installation</p> <p>D At two locations on shore (directly at the access to the vessel and at a sufficient distance) and in the wheelhouse</p>	
232 09.0-07	7.2.2.21	B
	<p>What is the function of the quick closing valve?</p> <p>A Automatic closure of valves in the connecting pipes between the shore installation and the vessel during gas release</p> <p>B Possibility of closing the quick closing valve located in the connecting pipe between the shore installation and the vessel</p> <p>C Automatic stopping of the unloading pumps if there is a gas release</p> <p>D Possibility of quickly shutting off unloading pumps if there is a gas release</p>	

## Practice

### Examination objective 9: Safety installations

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 09.0-08	7.2.2.21	C
<p>A vessel is connected by a loading facility with liquid and gas lines of a shore facility. A switch for the rapid closing devices is activated, thus stopping the loading. What happens after that?</p> <p>A Only the unloading pumps and the compressors on board the vessel are shut off</p> <p>B Only the shore facility's rapid blocking valve is closed</p> <p>C The quick closing valves are closed and the unloading pumps and compressors on board the vessel are shut off</p> <p>D The quick closing valves are closed and the loading installation is uncoupled from the breakage link</p>		
232 09.0-09	Rapid closing system	C
<p>Which of the following equipment is part of the rapid closing system?</p> <p>A Level gauge</p> <p>B Level warning</p> <p>C Quick closing valves in the loading installation</p> <p>D Breakage link in the loading installation</p>		
232 09.0-10	Rapid closing system	B
<p>In which case will the rapid closing safety system linked to the shore facility be activated?</p> <p>A When the level gauge is activated</p> <p>B When the safety system against overflowing is activated</p> <p>C When loading is carried out too quickly</p> <p>D When the cargo reaches too high a temperature</p>		
232 09.0-11	9.3.1.21.11	D
<p>If during the transport of refrigerated liquefied gas there is a leak in the connection to a shore installation, the water-spray system must be activated as a safety measure. Why?</p> <p>A To cool the refrigerated liquefied gas on the deck</p> <p>B To protect the wheelhouse and the accommodation from the cargo</p> <p>C To avoid an explosion on the deck</p> <p>D To protect the deck against brittle fracture given that the refrigerated liquefied gas evaporates quickly as a result of heating</p>		

---

## Practice

### Examination objective 9: Safety installations

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 09.0-12	Treatment of the cargo, 9.3.1.24.1 (a)	B
In what conditions may a LNG cargo remain indefinitely on board a type G vessel?		
A When the cargo tank or tanks is/are filled only to 86%		
B When a refrigeration system is available		
C When the crew constantly records the temperature		
D When critical pressure safety equipment is stopped		

---

## Practice

### Examination objective 10: Pumps and compressors

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 10.0-01	Basic general knowledge, Unloading of the cargo	C
	In which of the following cases is the residual cargo smallest?	
	A During unloading with an evaporator installed on shore	
	B During unloading with compressors installed on shore	
	C During unloading, with pressurized nitrogen from shore	
	D During unloading with submerged pumps of the vessel	
232 10.0-02	Basic general knowledge, Unloading of the cargo	D
	A vessel is equipped with two compressors and two deck pumps. Can propane be unloaded using the compressors only?	
	A No	
	B No, at least one pump is required	
	C Yes, always	
	D Yes, if the back pressure is not too great	
232 10.0-03	Basic general knowledge, Unloading of the cargo	A
	A vessel is equipped with two compressors and two deck pumps. Can propane be unloaded using only deck pumps?	
	A No	
	B Yes, always	
	C Yes, but it will take longer	
	D Yes, if the gas return flow in the shore tank is ensured	
232 10.0-04	Basic general knowledge, Deck pumps	B
	What safety mechanism is there on the deck pumps?	
	A A minimum filling level switch	
	B A motor temperature safety device	
	C An overpressure switch	
	D A breakage plate	
232 10.0-05	Basic general knowledge, Compressors	C
	What can cause major damage to a compressor?	
	A A closed inlet connection	
	B A too low operating speed	
	C Liquid intake	
	D Lack of a pressure difference between the intake and outflow sides	

---

## Practice

### Examination objective 10: Pumps and compressors

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
232 10.0-06	Basic general knowledge, Compressors	D
	Why is a low pressure switch often installed on the intake side of a compressor? A To protect the compressor B To avoid intake of liquid C To avoid too low a temperature D To avoid a depression in the cargo tanks	
232 10.0-07	Basic general knowledge, Deck pumps	A
	Why is a compressor required for the use of a deck pump? A To provide the deck pump with liquid B To empty the loading installation C To create a pressure difference in the pump D To transfer cargo into another cargo tank	
232 10.0-08	Basic general knowledge, Compressors	C
	What is the purpose of a separator on the intake side of a compressor? A To lubricate the compressor B To collect liquid so that it is not lost C To avoid damaging the compressor with liquid intake D To make it possible to eliminate the liquid gathered in the container using a flexible tube	
232 10.0-09	Basic general knowledge, Compressors	B
	Why is there an established maximum pressure difference between the intake and outflow sides of compressors? A To avoid too great a pressure difference in cargo tanks B To avoid overloading the compressor motor C To avoid a depression in the cargo tanks D To avoid the opening of the quick closing valves	

---

## Emergency measures

### Examination objective 1.1: Personal injury – Liquefied gas on skin

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
233 01.1-01	Liquefied gas on skin	B
	What first aid should be administered if a crew member has had liquefied butane spilled on his or her hands? A Briefly rinse the hands B Rinse the hands with water for at least 15 minutes C Treat the hands with an anti-burn ointment D Wrap the hands so that they are kept warm	
233 01.1-02	Liquefied gas on skin	A
	What should be done if a crew member has had liquefied butane spilled on his or her hands and they do not recover their natural colour after being rinsed with water for a relatively long period? A Call a doctor B Call the victim's family so that they can retrieve the victim C Put the victim to bed to keep the person warm D Treat the hands with an anti-burn ointment and wrap them	
233 01.1-03	Liquefied gas on skin	C
	What should be done if a crew member has had liquefied butane spilled on his or her body? A Immediately remove the clothing and pad the body with water and sterile cotton B Immediately remove the clothing and shower the person C Put the person in a shower, then remove clothing in the shower D Have the person sit, clothed, in a warm bath for at least 15 minutes	
233 01.1-04	Liquefied gas on skin	D
	What is the first thing to do if a crew member has had liquefied ammonia spilled on his or her hands? A Call a doctor B Have the person taken as quickly as possible to a burn centre C Apply an anti-burn cream copiously on the hands D Rinse the person's hands with water for at least 15 minutes	

---

## Emergency measures

### Examination objective 1.2: Personal injury – Breathing in gas

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
233 01.2-01	Breathing in gas	C
	What is the first thing to do if a member of the vessel's crew has inhaled a large quantity of propane but has not lost consciousness? A Have the person breathe freely B Give the person oxygen C Bring the person away from the danger zone and keep the person under surveillance D Bring the person away from the danger zone and lie the person down in a stable position	
233 01.2-02	Breathing in gas	D
	What is the first thing to do if a member of the vessel's crew has inhaled propane and has lost consciousness but is still breathing? A Mouth-to-mouth resuscitation B Give the person oxygen C Bring the person away from the danger zone and keep the person under surveillance D Bring the person away from the danger zone and lie the person down in a stable position	
233 01.2-03	Breathing in gas	A
	What is the first thing to do if a member of the vessel's crew has inhaled propane, has lost consciousness and is not breathing? A Bring the person away from the danger zone and apply mouth-to-mouth resuscitation B Give the person oxygen C Bring the person away from the danger zone and keep the person under surveillance D Bring the person away from the danger zone and lie the person down in a stable position	
233 01.2-04	Breathing in gas	B
	What is the first thing to do if a member of the vessel's crew has inhaled ammonia, is coughing and is having trouble breathing? A Give the person oxygen until there is no more coughing, then have the person lie down on a bed B Bring the person away from the danger zone, keep the person under surveillance and call a doctor C Shower the person and remove clothing D Apply mouth-to-mouth resuscitation and inform a doctor	
233 01.2-05	Breathing in gas	B
	A member of the vessel's crew has inhaled some propane gas. When should mouth-to-mouth resuscitation be applied?	

## Emergency measures

### Examination objective 1.2: Personal injury – Breathing in gas

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
	A If the victim has lost consciousness and is breathing	
	B If the victim has lost consciousness and is not breathing	
	C If the victim has not lost consciousness and is breathing	
	D If the victim has not lost consciousness and is not breathing	

---

## Emergency measures

### Examination objective 1.3: Personal injury – Emergency assistance, general

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
233 01.3-01	Emergency assistance, general	A
	What is the first thing to do if, during an inspection, a member of the vessel's crew feels sick in a hold space?	
	A Inform the master and provide first aid	
	B Enter the hold space and find out what happened to the victim	
	C Immediately remove the victim from the hold space with the help of a colleague	
	D Activate the "do not approach" signal	
233 01.3-02	Emergency assistance, general	C
	What is the first thing to do if a member of the vessel's crew trips on piping and has a serious fall?	
	A Apply mouth-to-mouth resuscitation	
	B Put the victim to bed	
	C Check if the victim has lost consciousness	
	D Inform a doctor	
233 01.3-03	Emergency assistance, general	C
	How can it be determined that a victim has lost consciousness as a result of an accident?	
	A Check whether the victim's pulse can be felt	
	B Check whether the thorax is moving and the victim is breathing	
	C Check whether the victim reacts to words or other stimuli	
	D Check whether the victim reacts to the smell of ether	
233 01.3-04	Emergency assistance, general	D
	If a member of the vessel's crew has inhaled a dangerous gas and has to be transported to hospital, what must absolutely be taken with him or her?	
	A The victim's service record	
	B The telephone number of the victim's family	
	C The victim's passport	
	D Information on the cargo	

---

## Emergency measures

### Examination objective 2.1: Irregularities relating to the cargo – Leak in a connection

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
233 02.1-01	Leak in a connection	A
	<p>What is the first thing to do if, during unloading, liquid drips from a connection between the pipes for loading and unloading and the loading facility?</p> <p>A Stop the pumps and close the corresponding blocking valves</p> <p>B Place a receptacle under the connection to collect the leak</p> <p>C Pump slowly</p> <p>D Place a wet towel around the connection and continue the unloading</p>	
233 02.1-02	Leak in a connection	B
	<p>What is the first thing to do if, during loading, a connection between the pipes for loading and unloading and the loading facility develops a leak?</p> <p>A Load more slowly</p> <p>B Stop the loading after consultation with the loading facility</p> <p>C Continue to load</p> <p>D Place a receptacle under the connection</p>	
233 02.1-03	Leak in a connection	C
	<p>What should be done if, during navigation with a loaded vessel, a place is found in the loading and unloading piping that is not leak-proof and all the shut-off valves are closed?</p> <p>A Activate the “do not approach” signal, moor the vessel and alert the authorities</p> <p>B Activate the “do not approach” signal and continue the voyage</p> <p>C Depressurize the piping</p> <p>D Continue the voyage without taking any additional measures</p>	

---

## Emergency measures

### Examination objective 2.2: Irregularities relating to the cargo – Fire in the engine room

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
233 02.2-01	Fire in the engine room	C
	<p>During loading, a fire breaks out in the engine room. What should be done, apart from extinguishing the fire?</p> <p>A Continue to load, but inform the shore facility</p> <p>B Just inform the shore facility</p> <p>C Activate the rapid blocking system and inform the shore facility</p> <p>D Call the shipping police</p>	
233 02.2-02	Fire in the engine room	A
	<p>A motor tank vessel has a cargo of UN No. 1011, BUTANE. A fire breaks out in the machine room while the vessel is under way. What should be done, apart from extinguishing the fire?</p> <p>A Inform the competent authority</p> <p>B Inform the consignee</p> <p>C Continue the voyage and activate the “do not approach” signal</p> <p>D Activate the water-spray system</p>	
233 02.2-03	Fire in the engine room	C
	<p>During unloading a fire breaks out in the engine room. What should be done, apart from extinguishing the fire?</p> <p>A Simply continue the voyage</p> <p>B Just inform the shore facility</p> <p>C Activate the rapid blocking system and inform the shore facility</p> <p>D Activate the “do not approach” signal</p>	

---

## Emergency measures

### Examination objective 2.3: Irregularities relating to the cargo – Hazards in the vicinity of the vessel

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
233 02.3-01	Hazards that might arise in the vicinity of the vessel	B
	<p>The vessel is moored at a shore facility and is ready to be unloaded. A fire alarm is activated at the shore facility. No fire is visible on the dock and in the vicinity. What must be done?</p> <p>A Disconnect the connections and depart with the vessel</p> <p>B Await instructions from the shore facility</p> <p>C Activate the water-spray system</p> <p>D Activate the “do not approach” signal</p>	
233 02.3-02	Hazards that might arise in the vicinity of the vessel	A
	<p>What must be done if, during unloading, a fire breaks out in close proximity on the dock?</p> <p>A Activate the rapid blocking system, disconnect the connections and depart with the vessel</p> <p>B Call the shipping police</p> <p>C Activate the water-spray system</p> <p>D Await instructions from the shore facility</p>	
233 02.3-03	Hazards that might arise in the vicinity of the vessel	B
	<p>What must be done if, while propane is being unloaded, there is a gas leak at the shore facility and the alarm is activated?</p> <p>A Activate the water-spray system</p> <p>B Await instructions from the shore facility</p> <p>C Continue to unload, but wear a breathing apparatus</p> <p>D Constantly measure the gas concentration on deck</p>	
233 02.3-04	Safety requirements, 7.2.4.16.17	A
	<p>The pressure is rising faster than expected in a cargo tank filled with refrigerated liquefied gas. The pressure in the cargo tank is likely to exceed the activation pressure for the safety valves before the cargo can be unloaded. What must be done?</p> <p>A The master informs the nearest emergency and security services</p> <p>B The master contacts the unloading berth</p> <p>C The master reverses course</p> <p>D The master opens the safety valve</p>	

---

## Emergency measures

### Examination objective 2.4: Irregularities relating to the cargo – Over-filling

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
233 02.4-01	Over-filling	A
<p>During loading with propane, the level gauges must be checked regularly. What should be done if a cargo tank is found to contain more than the amount permitted by the admissible maximum degree of filling?</p>		
A Have the loading stopped by the shore facility and pump the overflow into another cargo tank		
B Activate the rapid blocking system and pump the overflow into another cargo tank		
C Ensure that the admissible total quantity is not exceeded		
D During the rest of the loading, allow the overflow to flow into another cargo tank		
233 02.4-02	Over-filling	A
<p>During loading with butane, the level gauges must be checked regularly. What should be done if a cargo tank is found to contain more than the amount of the substance permitted by the admissible maximum degree of filling?</p>		
A Have the loading stopped by the shore facility and pump the overflow into another cargo tank		
B Separate this cargo tank and another of the cargo tanks, and using the compressor, force liquid into the other cargo tank while continuing to load		
C Ensure that the admissible total quantity is not exceeded		
D Do nothing, as in specific circumstances a little more cargo in one cargo tank may be taken		
233 02.4-03	Over-filling	D
<p>What should be done if the facility against overflowing is actuated during loading with propane?</p>		
A Disconnect the facility against overflowing and continue to load		
B Depart with the vessel, without undertaking any other action		
C As more cargo may be carried, there is no problem		
D Pump back some of the cargo until the admissible maximum degree of filling is reached		

---

## Emergency measures

### Examination objective 2.5: Irregularities relating to the cargo – Polymerization

<i>Number</i>	<i>Source</i>	<i>Correct answer</i>
233 02.5-01	Polymerization	C
During carriage of UN No. 1010, BUTADIENES (BUTADIENE-1-3), STABILIZED, the temperature rises in one of the cargo tanks. It may be assumed that the cargo has started polymerizing. What should be done?		
A Activate the water-spray system to cool the cargo		
B Fill the hold space with water to cool the cargo		
C Inform the consignee of the cargo		
D Release vapour from time to time		
233 02.5-02	Polymerization	B
During carriage of UN No. 1010, BUTADIENES (BUTADIENE-1-3), STABILIZED, the temperature rises in one of the cargo tanks. It may be assumed that the cargo has started polymerizing. What should be done?		
A Add the accompanying inhibitor		
B Inform the consignee of the cargo		
C Moor the vessel and inform the competent authority		
D Fill the hold space with water to cool the cargo		
233 02.5-03	Polymerization	D
During carriage of UN No. 1010, BUTADIENES (BUTADIENE-1-3), STABILIZED, the temperature rises in one of the cargo tanks. It may be assumed that the cargo has started polymerizing. What should be done?		
A Release vapour from time to time to cool the cargo		
B Activate the water-spray system to cool the cargo		
C Pump the product out of the cargo tank in question and mix it with the contents of the other cargo tanks		
D Inform the consignee of the cargo
