Recycling and Recovery Projects

Examples

- 1. UNFC testing for recovery of critical raw materials in Sweden from apatite iron ore tailings**
- 2. The potential to recover tungsten from a tailings pile in Portugal**
- 3. The potential to provide CRMs from Magnets in Austria**
- 4. Critical raw materials recycling projects in France**

UNFC testing for recovery of critical raw materials in Sweden from apatite iron ore tailings

**Ronald Arvidsson,
Anna Ladenberger,
Roger Hamberg, SGU**

with contributions from Erika Ingvald,
Lena Lundqvist, Magnus Johansson,
Jonathan Hamisi

of Sweden

Recovery of CRMs in Sweden

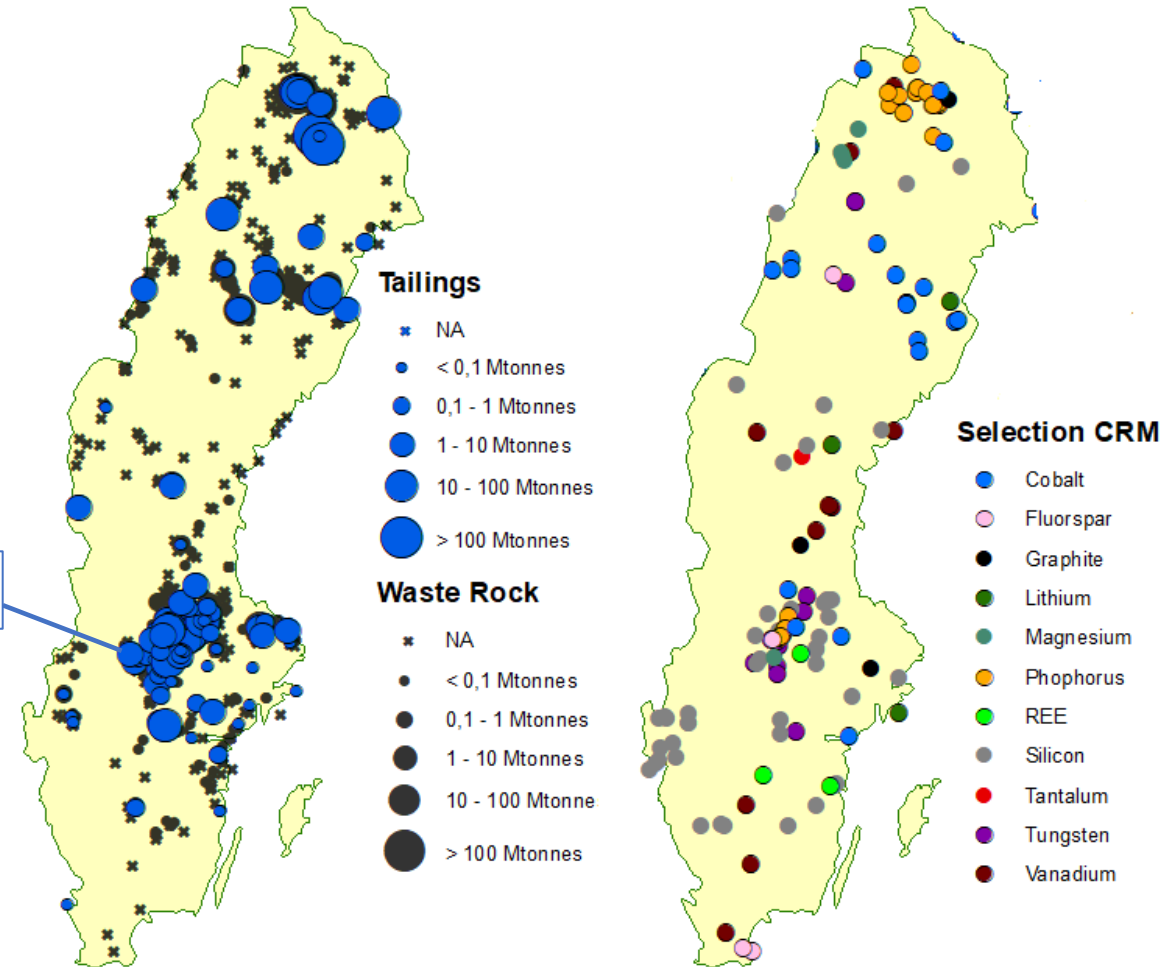

Mission from the government development of UNFC and characterization of mining waste

- Some data >1000 sites
- About 70 sites waste sites sampled and characterised
- 14 tailings – drill and dense sampling and modeling

Specific case here – Grängesberg tailings

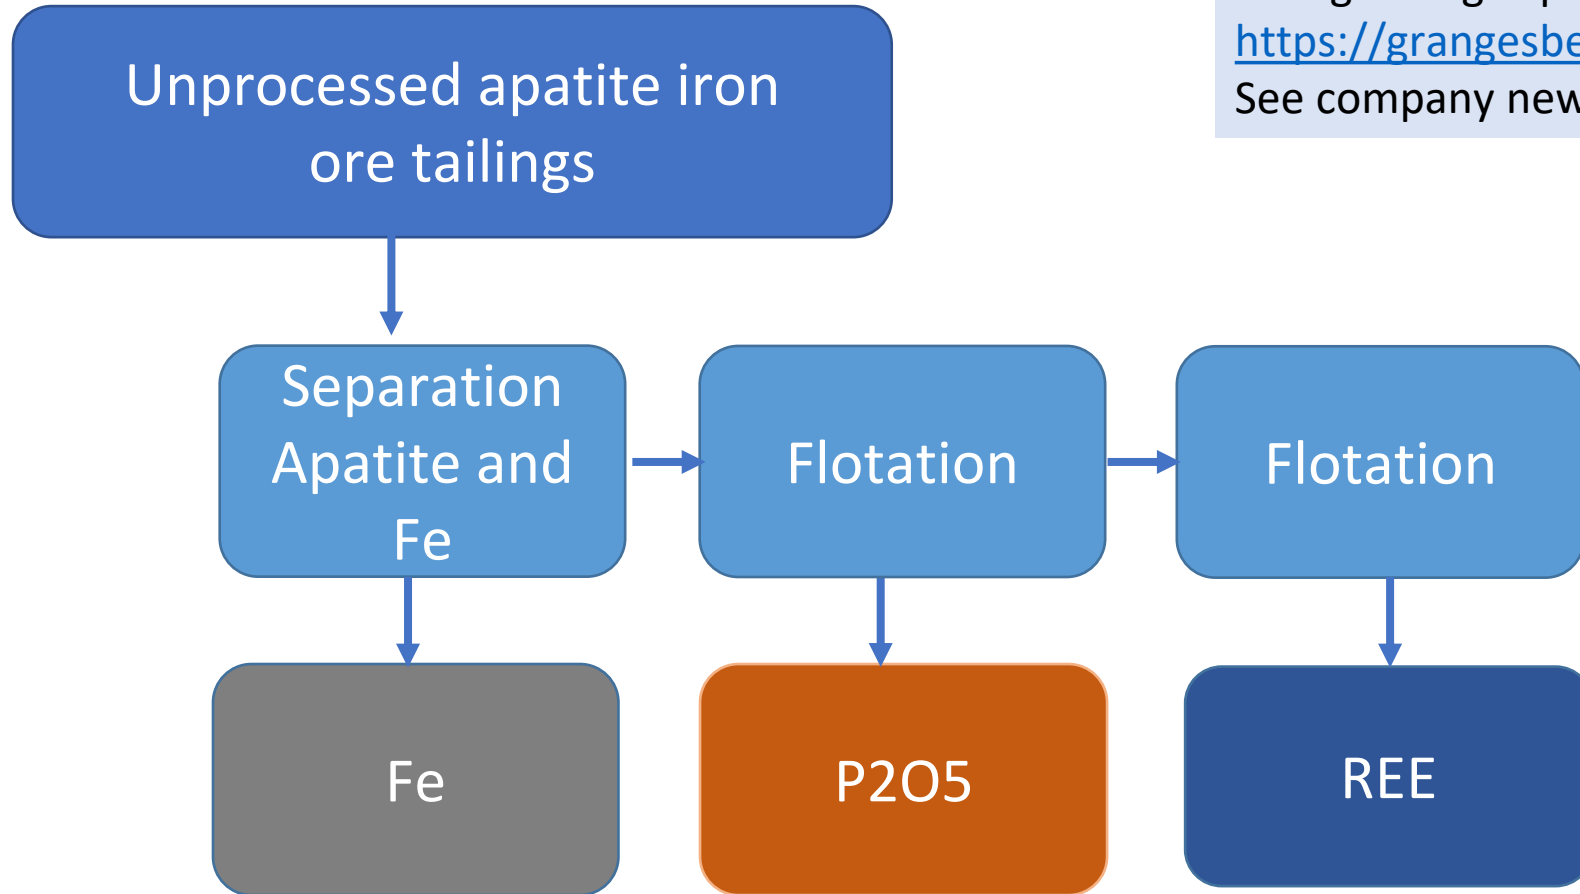

- 135 Mtonnes extracted apatite iron ore
- Target Jan-Matts tailings
 - Resources 3.4 Mtonnes (2022)
- Exploration continues

Grängesberg

Recovery of CRMs in Sweden

Grängesberg Exploration Holding AB
<https://grangesbergexploration.se>
See company news and scoping study

Conceptual study

- Resources
 - 3.46 Mtonnes
 - P₂O₅ 5.46%
 - Fe 9.46%
- Technical solution - P₂O₅ concentrate
- REE – technical solution not yet mature
- Permits under development

Apatite concentrate
16.3% P -> 304 kt

UNFC is an instrument that in this case allows

- Snapshot in time - current project status
- Challenge - extract CRM REE, permitting procedure
- Recovery of CRM depends upon recovery of other RM
- UNFC enables comparison between
 - different commodities like P_2O_5 , Fe and REE
 - other cases

The Potential to Recover Tungsten from a Tailings Storage Facility in Portugal

Rudolf Suppes (Holcim)
Soraya Heuss-Aßbichler (LMU)

Potential Recovery of Tungsten in Portugal

Introduction

Goal: test application of UNFC to base metal tailings (scientific scoping study)

Scope: private company

Research question: how is a case rated with CRIRSCO & UNFC ?

Materials: peer-reviewed scientific literature, public materials, model assumptions

Assessment & classification approach¹:

define project → characterise material → evaluate status → categorise & classify

¹adopted from: Mueller et al. (2020)
<https://doi.org/10.1016/j.jclepro.2020.120490>

General information

- Cabeço do Pião part of Minas da Panasqueira
- Abandoned in 1996 after ~ 90 years of operation
- $V_{\text{tailings}} = 0.7 \text{ mio. m}^3$
- Issues: physical instability, heavy metal pollution & acid mine drainage

Scenarios:

- S0: rehabilitation
- S1: FeWO_4 & ZnS recovery $\sim 1 \text{ wt } \%_{\text{tailings}}$
- S2: FeWO_4 , ZnS , CuFeS_2 , FeS_2 recovery $\sim 24 \text{ wt } \%_{\text{tailings}}$

Potential Recovery of Tungsten in Portugal

RESULTS

 **S1 & S2 are economic** (W main economic driver & risk)

	Communicated Information	CRIRSCO	UNFC
S0	economically not viable		
S0	raw material potential preserved for future		
S1	economic viability (relevant element: W)		
S2	higher returns (additional relevant elements: Cu, S & Zn)		
S0, S1 & S2	externalities (due to current & continued pollution)		

✓ UNFC is applicable to base metal tailings

• **UNFC's strengths compared to CRIRSCO:**

- more aspects are considered → creates transparency
- sustainability highlighted → environmental & social benefits are driving factors

UNFC's development potential:

- more sophisticated categorisation on E-axis
- improvement of user guidance

The potential to provide CRMs from Magnets in Austria

Andrea Winterstetter
KRAIBURG TPE

Compare two scenarios for **future utilization of end-of-life permanent magnets in wind turbines, in use in Austria (2014)**

- Reuse vs Recycling?
- Focus on economic viability and technical feasibility
- Develop suitable management strategies for future waste flows

Evaluation and classification of different types of anthropogenic resources: the cases of old landfills, obsolete computers and in-use wind turbines

A. Winterstetter^{a,*}, D. Laner^a, H. Rechberger^b, J. Fellner^a

^a Christian Doppler Laboratory for Anthropogenic Resources, Resource and Waste Management, Technische Universität Wien, Karlsplatz 13/226, 1040 Vienna, Austria

^b Institute for Water Quality, Resource and Waste Management, Technische Universität Wien, Karlsplatz 13/226, 1040 Vienna, Austria

- Winterstetter et al. (2021) "The role of anthropogenic resource classification in supporting the transition to a circular economy." J. of Cleaner Production, <https://doi.org/10.1016/j.jclepro.2021.126753>

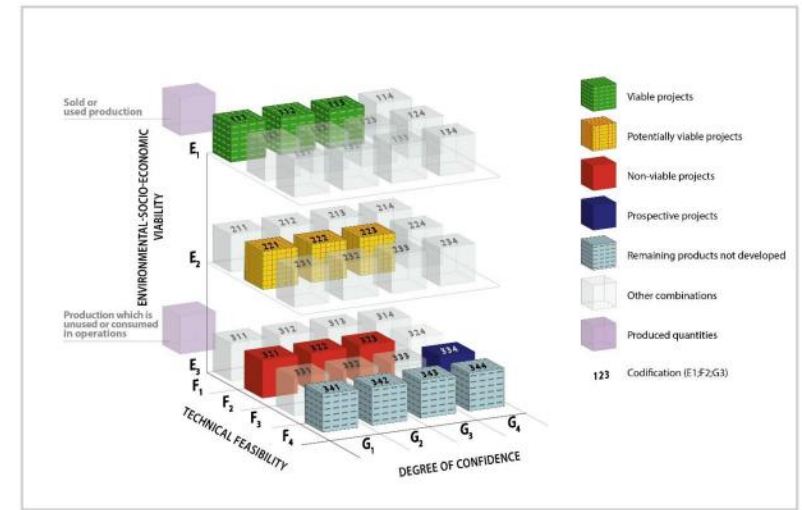

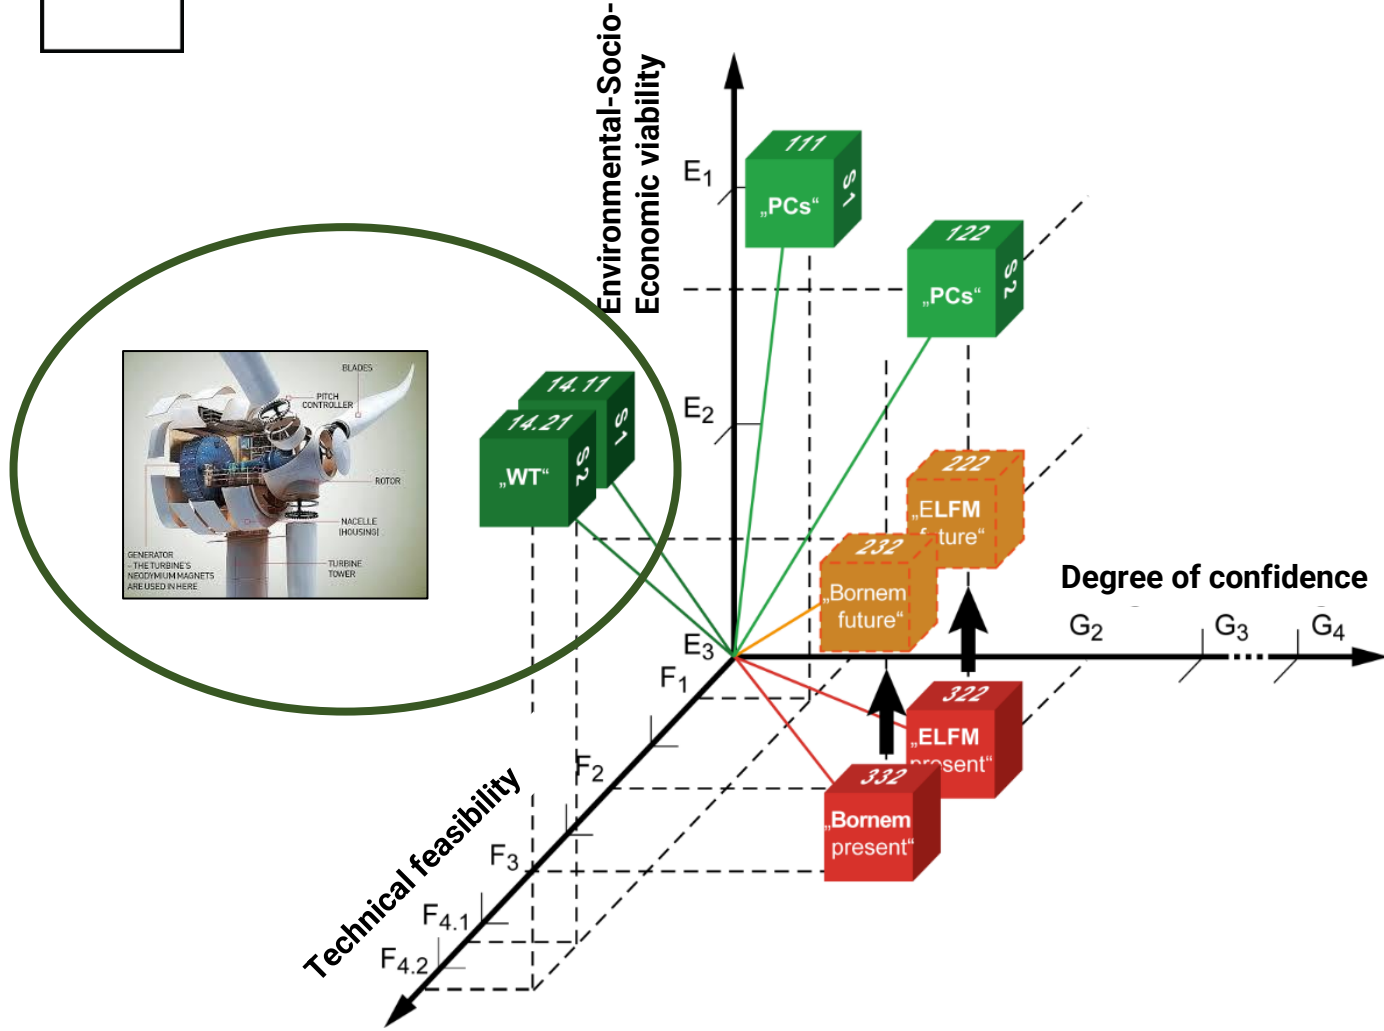

Potential of CRMs from Magnets in Austria

Reuse vs recycling of magnets

	Scenario 1 - Reuse	Scenario 2 - Recycling
Type of deposit	NdFeB permanent magnets in wind turbines in Austria	
Data source	Data on production & installation of wind turbines & their capacity in Austria	
Different options for dismantling	Reuse of permanent magnets	Hydrometallurgical method to extract Nd,Fe,B, Dy & Pr
Cost	Separating magnets & demagnetization	Separating magnets & demagnetization Rare earth elements extraction from magnet
Prices for secondary products	Price of used permanent magnets	Prices of REE and metals

Potential of CRMs from Magnets in Austria

Results

Resource classification has to be performed on a case by case basis:

1. Drivers of the project
2. Site-specific parameters
3. Project-specific parameters
4. Systemic context
5. Timing of mining

Provides decision support for mining the anthroposphere

- establish **inventories** of available and accessible anthropogenic resources at regional and national level
- compare different **resource recovery projects & scenarios**
- makes critical factors & potential **barriers visible**

Critical raw materials recycling projects in France

Daniel Monfort
Léane Verhulst BRGM

- First action after DG GROW request in 2021, map ongoing and potential primary CRM projects in France using UNFC (around 40 sites/projects)
- But we stayed also 2 facts
 - France is already a producer of some CRM as a by-product (In from Zn and Hf from Zr)
 - France is also a CRM producer via recycling (mostly WEEE)

Include ongoing projects producing CRM after recycling or after by-product recovery process

Viable projects in terms of UNFC

CRM recycling projects in France

Potential viable projects

- 2nd step, evaluate potential viable CRM recycling projects (industrial projects in upscaling process)
 - Batteries and WEEE
- Evaluation with publicly accessible data
- Checklist:
 - **The degree of maturity** of recycling projects.
 - **Projects in industrial plants** with already the environmental authorizations?
 - **Knowledge of the composition** of the recycled products/flows
 - Chemistry of batteries, chemistry of permanent magnets, etc.
 - Which capacity to collect the waste streams? Partnership with **waste collector**?
 - Information about quantities. Expected annual production?

- Projects producing secondary CRMs can be mapped and classed in UNFC terms quite "easily"
- Keep in mind the comparability with primary resources!
- UNFC is a good tool to monitor the progress of projects and which criteria is "blocking": acceptability, feasibility, waste collection...

	Viable projects	Potential viable	Non-viable projects
Primary resources	Quarries and mines exploiting and producing	Active research & exploration permits	Non active projects
Secondary resources	Recycling plants	Recycling R&D projects of industrial upscaling.
