

GDP Flash Estimate and GDP Nowcast: An R-Shiny App for GDP Estimation

Arne Ackermann

Meeting of the Group of Experts on National Accounts

Session 3: Real time indicators & nowcasting

25-27 April 2023

Outline

1. Background
2. Econometric approach
3. R-Shiny App
4. Outlook

1. Background: Early GDP estimates in Germany

- » Purely econometric approach
- » For internal use only
- » Expert and econometric approach
- » Publication of GDP flash
- » Expert approach
- » Publication of detailed results

2. Econometric approach

- » **Bottom-up approach:** GDP as sum of its aggregates
- » **Production side** (gross value added of 15 sectors), **expenditure side** (9 aggregates)
- » **Two-step approach** to estimate aggregates (**bridge equation**)

- » Estimation method: **seasonal ARIMA models with external regressors**

2. Econometric approach: Challenges

- » Economic plausibility checks of estimation results
- » Testing and inclusion of new data sources, e.g. new digital data
- » Dealing with crises such as the corona pandemic and the Ukraine war

3. R-Shiny-App

- » **Development of an R-Shiny environment for econometric estimation of GDP and its main aggregates**
- » **Advantages:**
 - » Compact graphical representation of the estimated GDP aggregates including models, indicators and predictors
 - » Easy inclusion of new (digital) data in the existing data set and estimation models
 - » Flexible adaption of models and evaluation thanks to mapping of model parameters
 - » Clear and user-friendly user interface

3. R-Shiny App: Data input

3. R-Shiny App: example private consumption

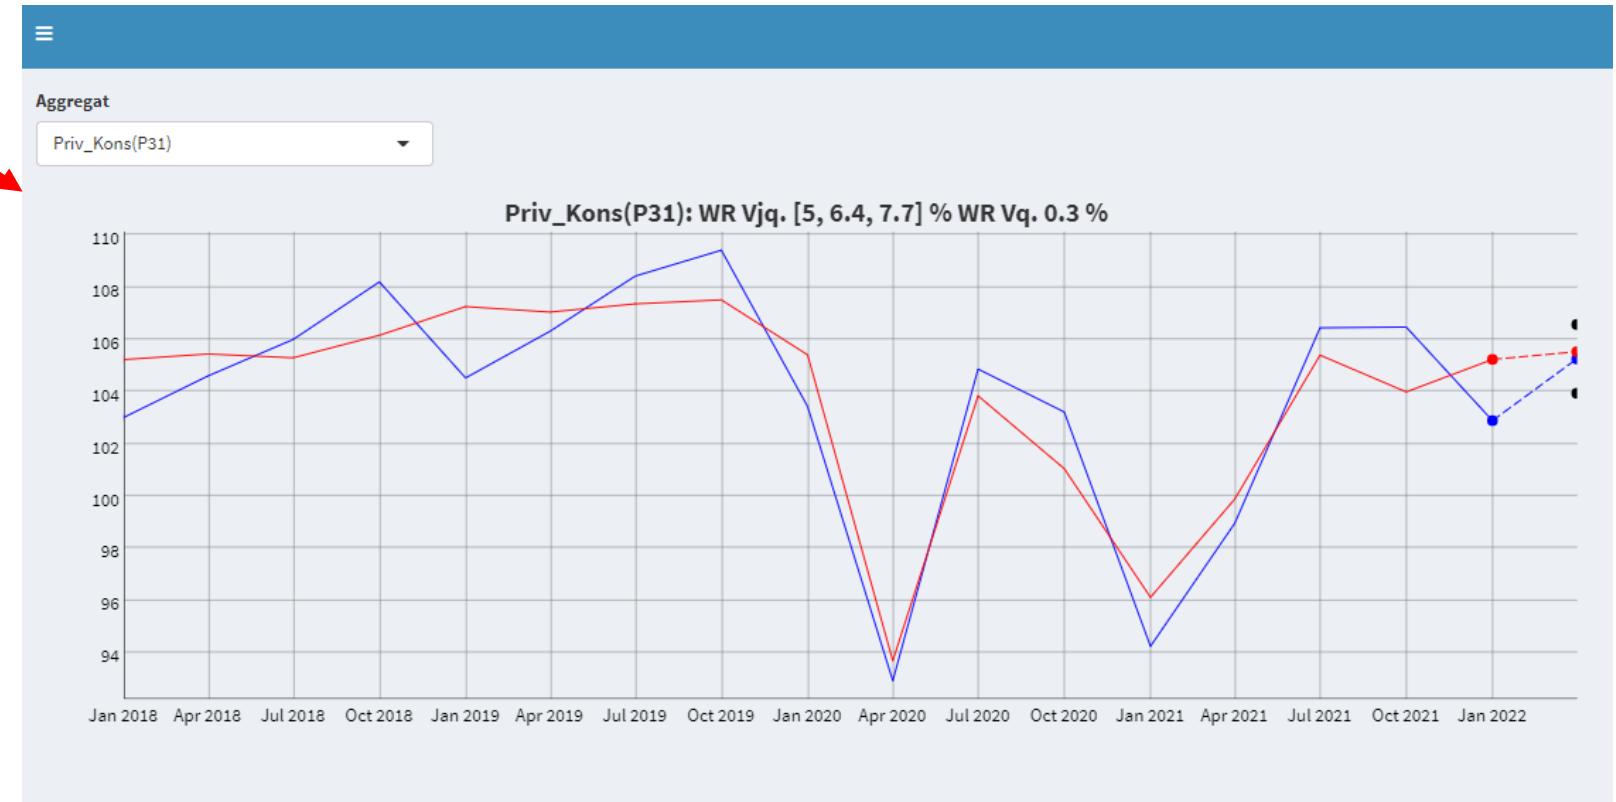

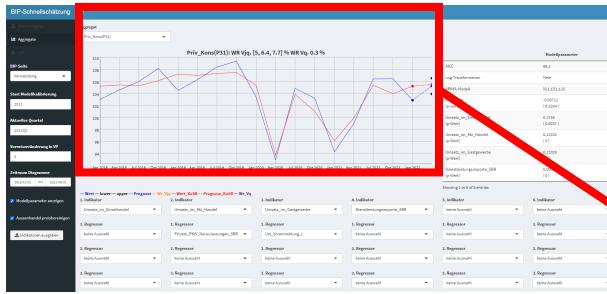

This section shows a detailed view of the R-Shiny app's parameter selection interface. It is organized into four rows, each containing two columns of dropdown menus. The first row is labeled '1. Indikator' and contains four dropdowns: 'TO retail trade', 'TO motor vehicles trade', 'TO acc. & food services', and 'Import of services'. The second row is labeled '1. Regressor' and contains four dropdowns: 'keine Auswahl', 'Passeng. car registration', 'Adv. VAT ret. acc. & food', and 'keine Auswahl'. A large red arrow from the previous screenshot points to the first four indicator dropdowns in this row.

1. Indikator	1. Indikator	3. Indikator	4. Indikator
TO retail trade	TO motor vehicles trade	TO acc. & food services	Import of services
1. Regressor	1. Regressor	1. Regressor	1. Regressor
keine Auswahl	Passeng. car registration	Adv. VAT ret. acc. & food	keine Auswahl

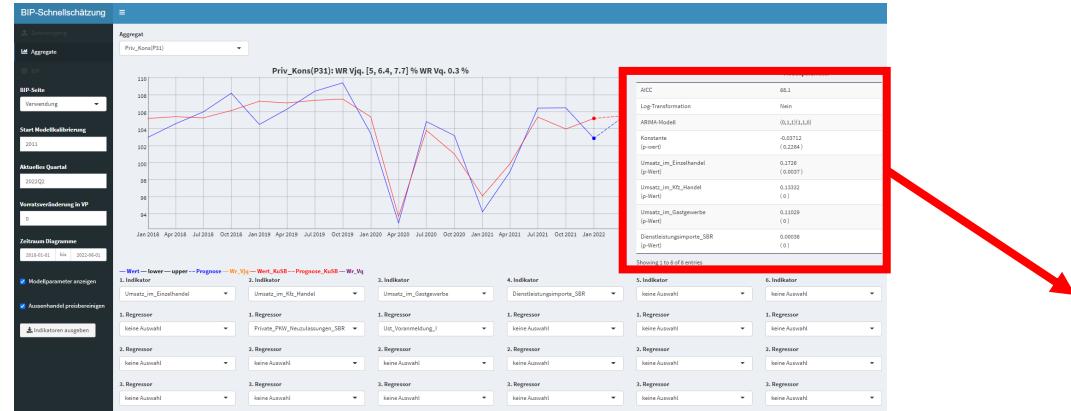

3. R-Shiny-App: example private consumption

3. R-Shiny App: example private consumption

3. 3. R-Shiny App: example private consumption

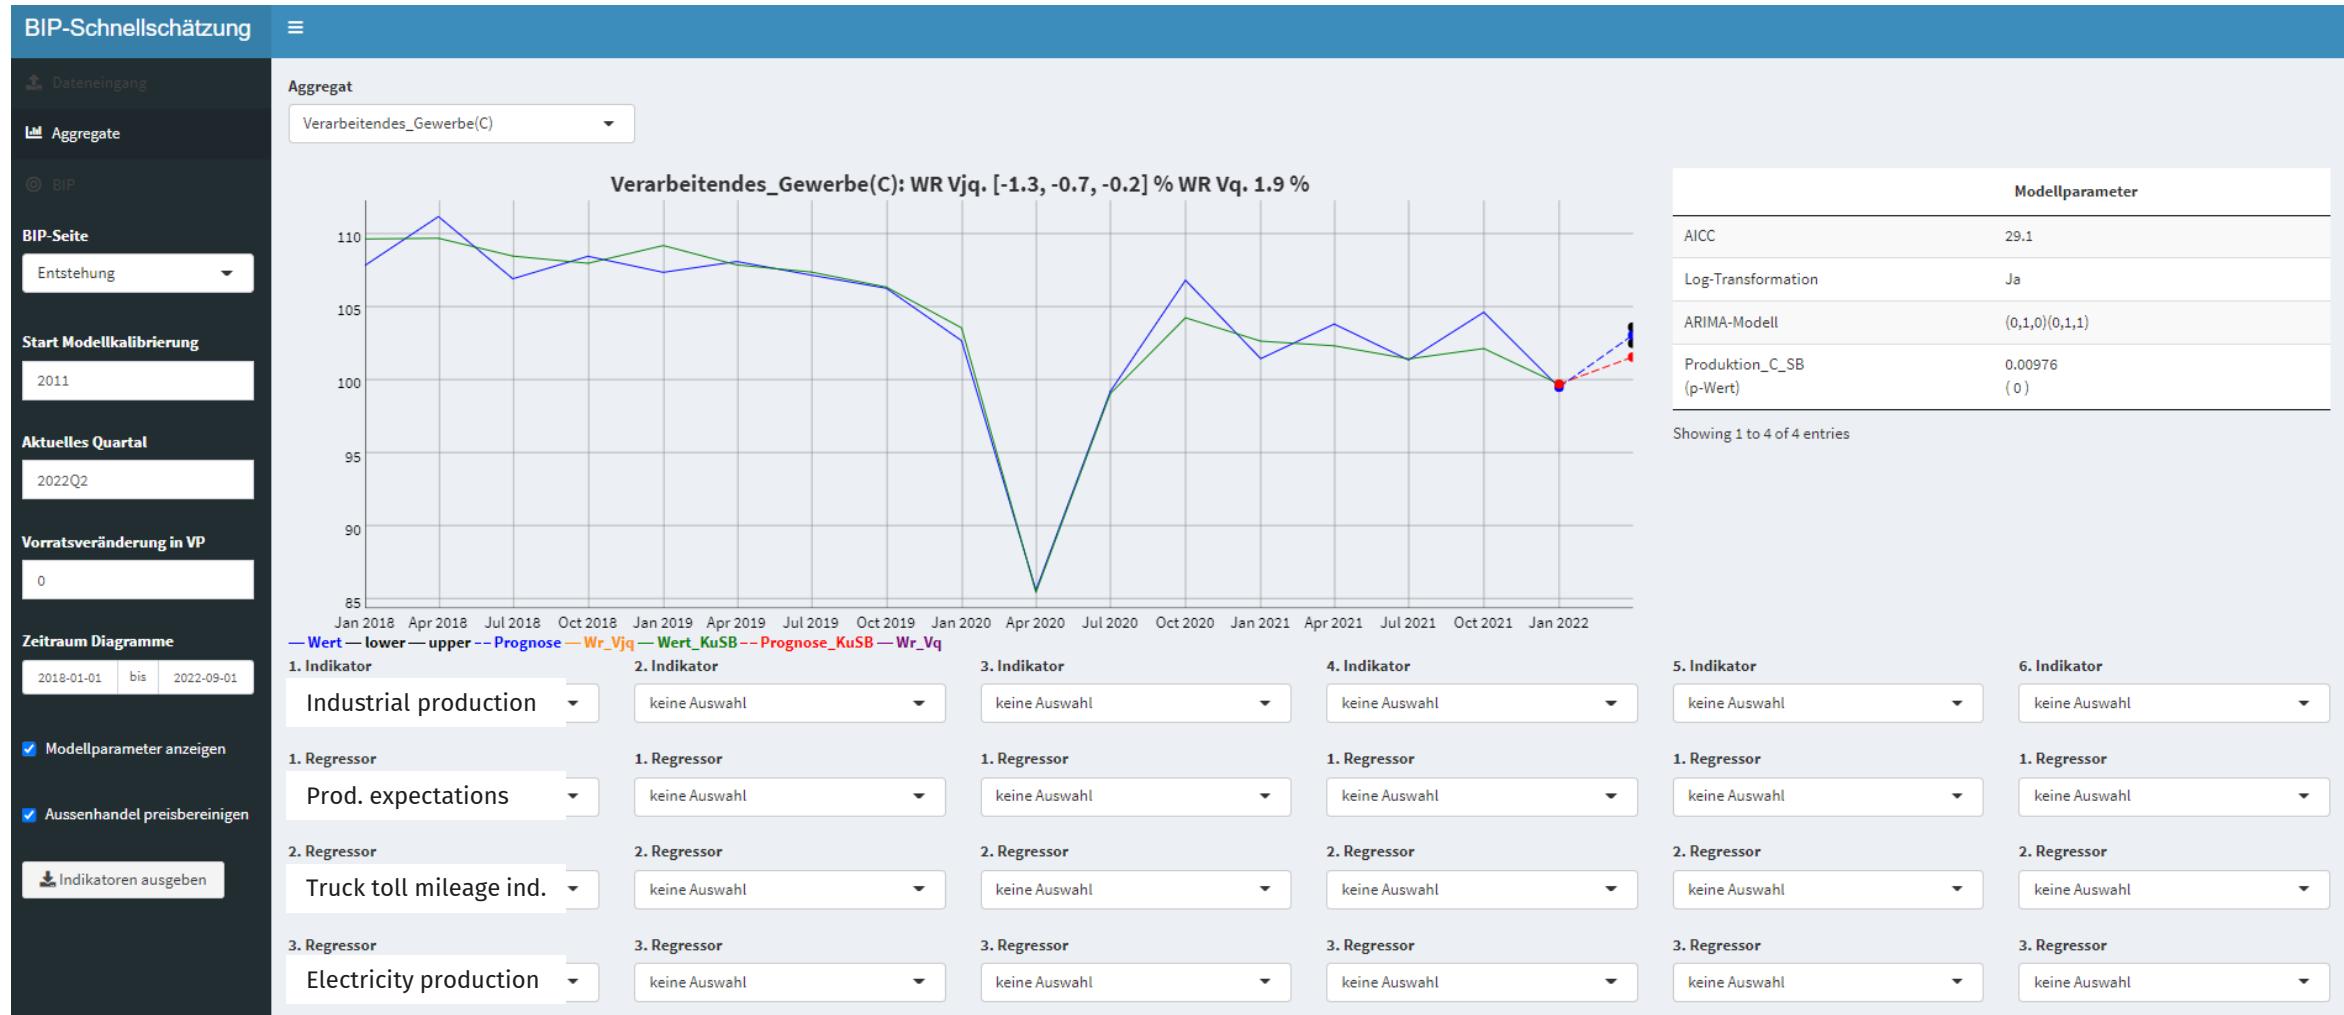

Modellparameter	
AICC	68.1
Log-Transformation	Nein
ARIMA-Modell	(0,1,1)(1,1,0)
Konstante (p-wert)	-0.03712 (0.2264)
TO retail trade (p-Wert)	0.1726 (0.0037)
TO motor vehicles trade (p-Wert)	0.13332 (0)
TO acc. & food services (p-Wert)	0.11029 (0)
Import of services (p-Wert)	0.00036 (0)

Showing 1 to 8 of 8 entries

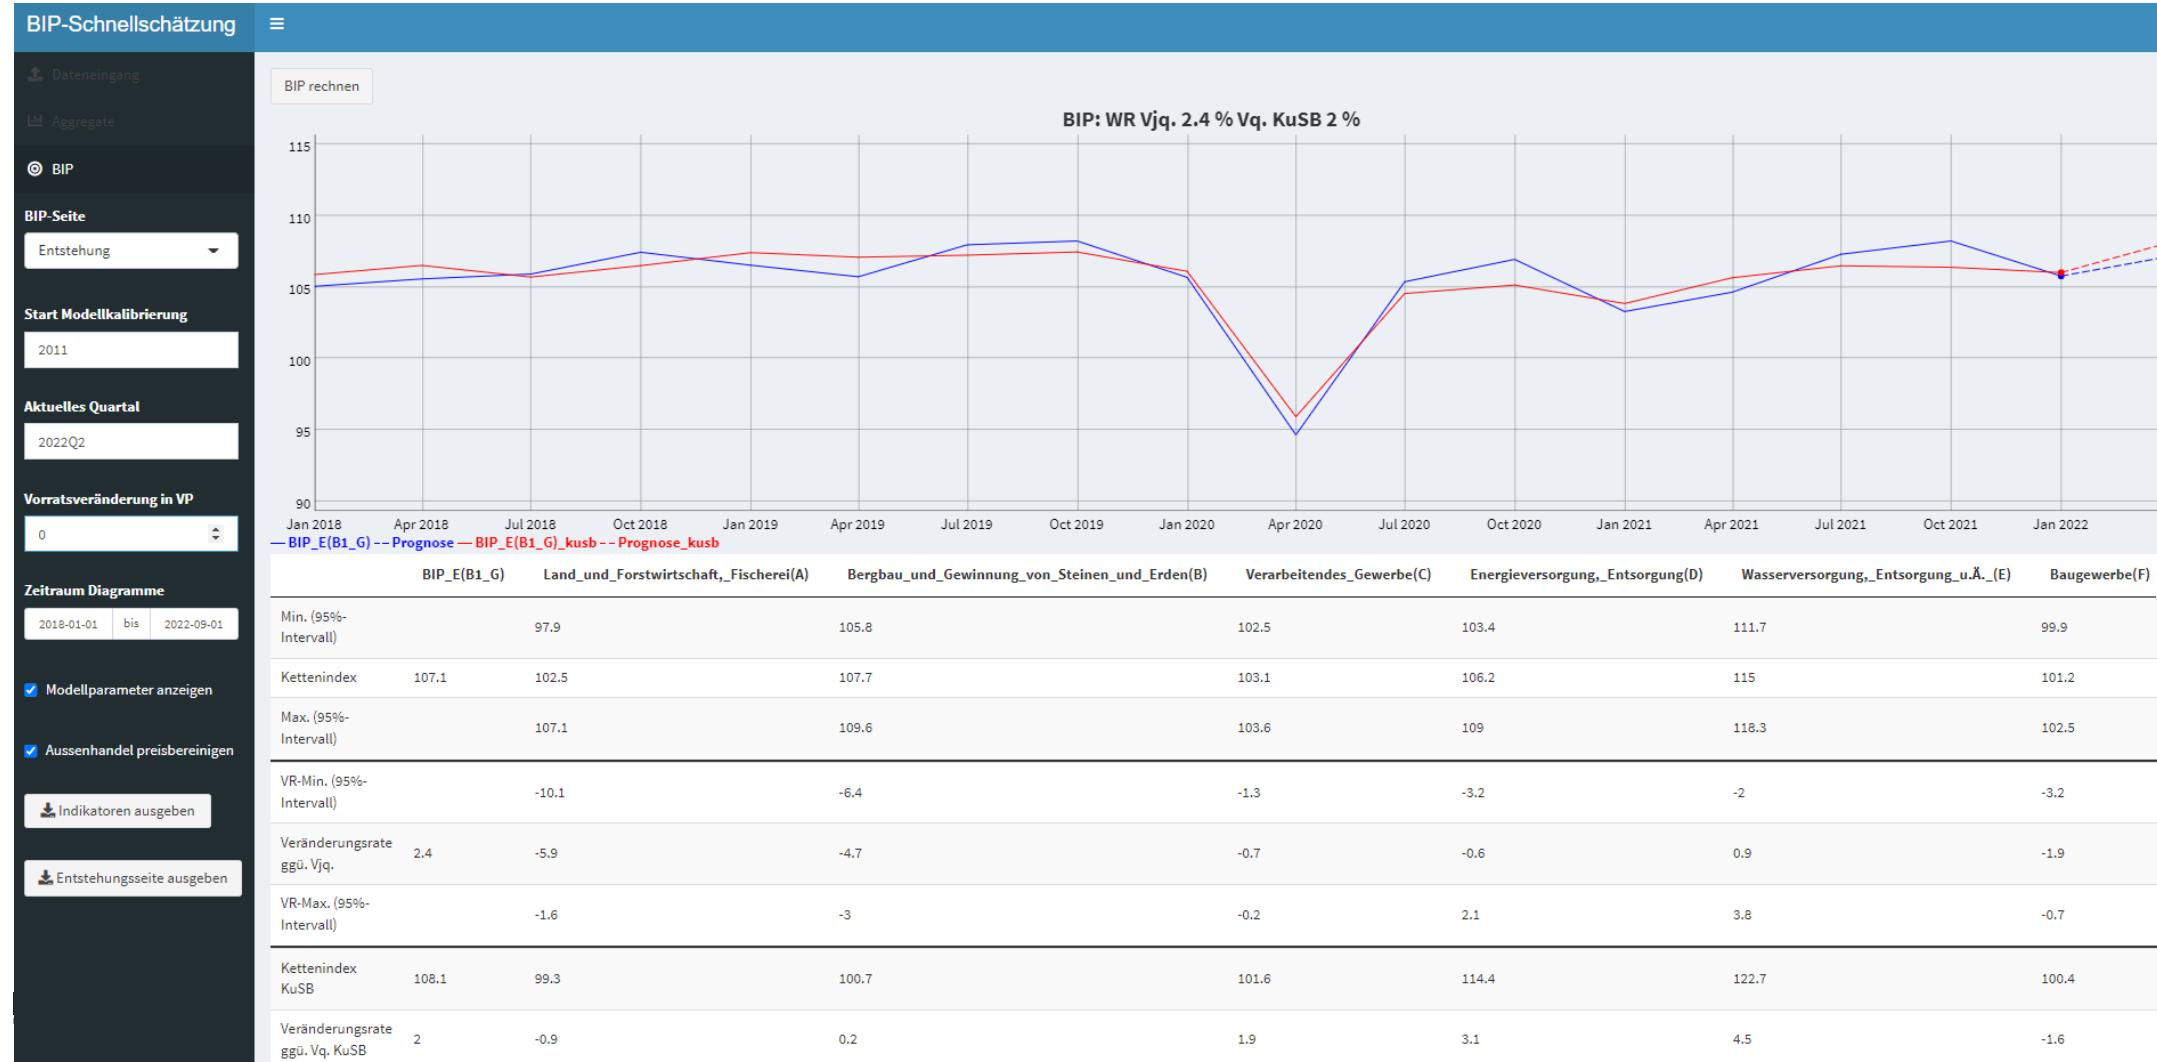

3. R-Shiny-App: aggregated GDP (expenditure side)

3. R-Shiny-App: example GVA manufacturing

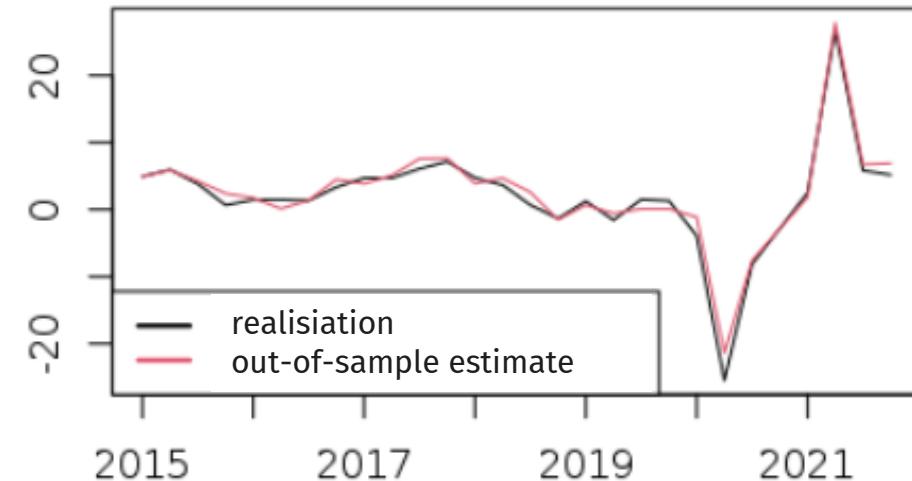

3. R-Shiny-App: aggregated GDP (production side)

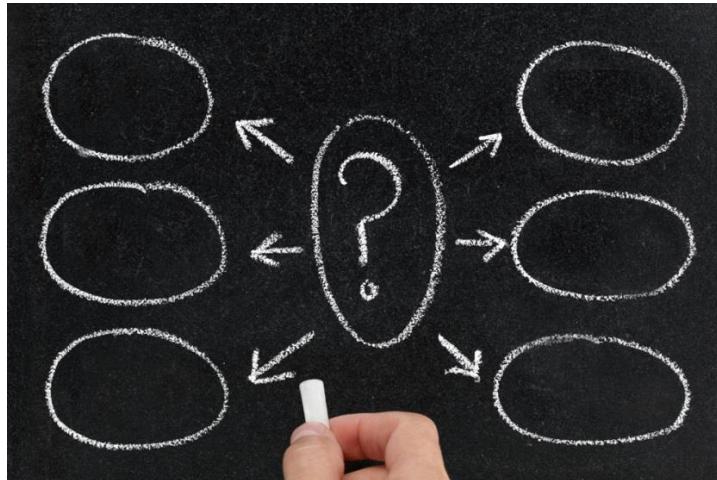

4. Outlook

- » Increase depth of estimation (divide large or important areas)
- » Inclusion of an **(pseudo) out-of-sample analysis** inside the application:
 - » Estimation and illustration of **estimation errors**
 - » Additional criterion for **model selection**

Questions?

Special thanks to Dr. Claudia Fries, Dr. Joao Claudio and Xaver Dickopf.
