

Electric Vehicles and the Environment (EVE IWG)

1

REPORT TO 89TH GRPE SESSION

Recent EVE Meetings

2

- Virtual meetings
 - 60th EVE IWG March 24 and 27, 2023
- In –person meetings
 - 61st EVE IWG – April 25-26, 2023, in Ann Arbor, U.S.A. →
 - 62nd EVE IWG – May 30, 2023, concurrent with GRPE

“Go Blue!”

Current Work

3

- **Hybrid power determination (GTR-21)**
 - EVE continuing to develop the GTR based on the experiences of stakeholders
- **In-vehicle battery durability (GTR-22) – Light-duty**
 - Consider further development and refinement of GTR 22
- **New GTR for in-vehicle battery durability – Heavy-duty**
 - Seeking authorization at 190th WP.29 session
 - Building from GTR-22, shaping around unique circumstances of heavy-duty vehicles.

GTR-21 Development: Hybrid Power Determination

4

- Efforts on GTR-21 are focused refining the text and test procedures
 - Consideration of CAN signals in place of direct measurement
 - ✦ Data analysis ongoing
 - Appropriate accuracy requirements
 - ✦ Reviewing the source of current values
 - Measurement alternatives for highly integrated systems
 - ✦ Considering the use of vehicle CAN signals in lieu of instrumented values
 - ✦ China provided additional test data this week
 - Considering alternative for system bench testing
 - Develop family concept
 - ✦ Proposal from Japan reflected in the current draft update
 - Need for Candidate Method – still on hold, may not be required

GTR-22 Development: LDV Battery Durability

5

- GTR-22 was finalized in 2022
- Gaining experience with the GTR
 - Included in the implementation of Euro 7
 - Included in the US EPA's LMDV Multipollutant Standards for 2027+ MY proposed rulemaking
- EVE is focused on several issues
 - Temperature data requirements and consideration of CARB requirements
 - Accounting for energy consumption not related to mobility, with focus on category-2 vehicles that may have ancillary, non-propulsion electrical loads
 - ✦ Verification procedure is required and open issue
 - Category-2 minimum performance requirements

GTR-22 Development: LDV Battery Durability

6

● MPR for Category 2 vehicles

- OICA presented slides at EVE 61 on energy throughput in order to show options for the MPR
- Main challenges for the energy throughput remain the determination of thresholds for the MPR and energy throughput verification
- The European Commission made a proposal to change the V2X concept
 - All Energy not used for traction is accounted for in the virtual mileage
- The group agreed to the proposal and the GTR-22 draft has been revised accordingly

3.25. “Total discharge energy for non-traction purposes” means the **total amount of energy in Wh discharged from the battery for purposes other than traction to support the particular use case of a Category-2 vehicle** and do not include air conditioning/heating for the cabin or other uses already present in categories 1-1 and 1-2.

$$\textit{Virtual distance} (km) = \left(\frac{\text{total discharge energy during V2X and for non – traction purposes}^{\dagger} [Wh]}{\text{worst case certified energy consumption of PART B family} [Wh/km]} \right)$$

Heavy-duty Durability GTR

7

- Heavy-duty in-vehicle battery durability is now the most significant work being performed by the EVE IWG
- While the overall framework of GTR-22 is helpful, there is limited technical similarity
 - Light-duty test procedures with respect to electrified vehicles are more mature
 - Light-duty vehicle activity is relatively homogenous
 - Heavy-duty vehicle activity and energy demands can vary significantly between applications (e.g. PTO, non-traction loading)
- Potential common elements: SoH monitor, test procedure for verifying the monitor, initial battery condition, in-use assessments and minimum performance requirements

EVE-57-10-Rev1a

@ Different possibilities for certification and in-service testing of HDV and LCV

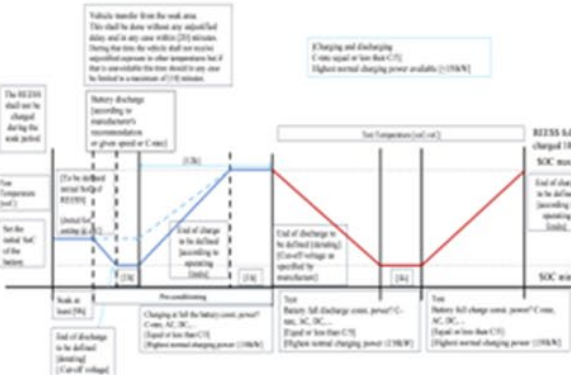

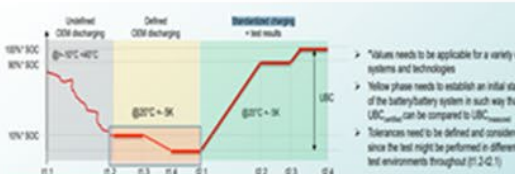

Options Testing	Charge/Discharge test	Chassis-Dynamometer LCV segment ¹⁾ only	Battery System testbench	Any other...
Reference test	<ul style="list-style-type: none"> + Simple/low effort - Limited power level <p>Total vehicle coverage to be evaluated</p>	<ul style="list-style-type: none"> + No limitation of discharge power level + Chassis dyno already established for light duty (in GTR 22) - Additional test procedure for determination of reference value (during type approval) 	<ul style="list-style-type: none"> • Due to complexity and lack of accuracy when disassembling single packs or whole systems and reassemble with virtual vehicle control, OICA came to the conclusion to not consider it as a technical feasible procedure 	<p>However, industry continues to develop a universally valid test procedure.</p>
In-Service test	<ul style="list-style-type: none"> + Simple/low effort - Limited power level 	<ul style="list-style-type: none"> + No fundamental impact on customer vehicles + Vehicle/ Battery operated as customer experience - Need of chassis dyno for ISC testing 		<p>Our target is to present results during next IWG EVE.</p>

1) No option for heavy duty due to feasibility and availability

- Summary of alternatives presented by OICA
- Each alternative has pluses and minuses
- Goals
 - Identical procedure for Reference Test and In-service Test
 - Leverage experience and existing capabilities of manufacturers and regulatory authorities

Heavy-duty Durability GTR

Test procedures under discussion

Proposed test procedures		
<p>Round Trip Efficiency (RTE) test (full discharge – full charge cycle)</p>	<p>Standardised charging</p>	<p>Cycles test method by using HD chassis dynamometer</p>
 <p>The diagram illustrates the Round Trip Efficiency (RTE) test procedure. It shows a cycle starting with a vehicle in a soak area, followed by a discharge phase at different temperatures (e.g., 0°C, 20°C, 40°C) and SOC levels. The discharge is followed by a charging phase, also at different temperatures. The test concludes with a REESS fully charged to 100% SOC. Key parameters include temperature (T_{amb}), SOC, and charging/discharging power (C_{rate}).</p>	 <p>The diagram shows a standardised charging procedure. It starts with a discharge phase at 0°C and 10% SOC, followed by a charging phase at 20°C and 90% SOC. The test concludes with a REESS fully charged to 100% SOC. Key parameters include temperature (T_{amb}), SOC, and charging/discharging power (C_{rate}).</p>	 <p>The measurement method of the on-board battery UBE. China proposes to add cycles test method by using HD chassis dynamometer to measure UBE, which is used to calculate on-board battery SOCE. The test method is shown below.</p> <p>UBE test flow chart</p> <pre> graph TD A[REESS fully charged 100%] --> B[Soak at least 12h; REESS should not be charged during the soak period] B --> C[dynamometer setting; Brake energy recovery unit off; Air conditioning off; set coasting resistance] C --> D[Test method] D --> E[Test over] E --> F[Data calculation; UBE_{measured} calculation] F --> A G[Test scheme (4 cycles allow 1 stop)] --> E H[The test termination when actual speed cannot reach the target speed] --> E </pre>

Current Timeline

11

- **June 2023:**
 - Propose, to WP.29 AC.3, the development of new UN GTR on in-vehicle battery performance and durability of electrified heavy-duty vehicles (eHDV)
- **May 2021 - June 2023:**
 - Support the Group of Experts on Energy Efficiency on the method for stating energy consumption from upstream emissions of electrified vehicles
- **June 2021 – June 2023:**
 - Consider candidate test method, family concept and further validation testing for UN GTR 21
 - Continue information gathering on possible modifications to the UN GTR 22 on in-vehicle battery durability
 - Consider other GTR amendments, as necessary
- **January 2024:**
 - Provide status update and draft UN GTR on eHDV battery performance and durability as an informal document, for further discussion and recommendation
 - Provide update on the future framework for UN GTR on eHDV battery performance and durability
 - Submit working document to GRPE for UN GTR 21 amendments, for consideration
 - Submit working document to GRPE for UN GTR 22 amendments, for consideration
- **June 2024:**
 - Submit working document of UN GTR on eHDV battery durability to GRPE for consideration
 - Submit working document amendments for UN GTR 21 to WP.29 AC.3 for vote, if authorized
 - Submit working document amendments for UN GTR 22 to WP.29 AC.3 for vote, if authorized
- **November 2024:**
 - Submit working document of UN GTR on eHDV battery durability to WP.29 for vote, if authorized

Proposed Future EVE Meetings

12

- 63rd EVE IWG – July 18-19, 2023 (virtual)
- 64th EVE IWG – September 19-20, 2023 (virtual)
- 65th EVE IWG – October 11-12, 2023 (in-person – Ottawa, Canada)

Thank you!
