Income and Poverty Estimates

• Household survey nonresponse is increasing
  • 11% in 2013 to 31% in 2023 (March Current Population Survey)

• For those that respond to the survey, many do not answer income questions
  • ~45% of income in official poverty estimate imputed for nonresponse

• For those that answer income questions, many underreport
  • We estimate 1.1 percentage points fewer people in poverty (~3.5 million people) than official estimates
What is NEWS?

• Rethink how we produce income and resource statistics
  • What is the best possible estimate given all the data currently available at Census for a given income/resource statistic?

• Address multiple sources of bias simultaneously
  • Apply research on addressing each
How Does NEWS Do This?

• Pull together all available data: survey, census, administrative records, commercial (third-party) data
  • Often need *linked* data to address bias correctly
• Do everything in a transparent, replicable, evidence-based manner
• Engage research community
  • Will create linked microdata and code database for access in FSRDCs
  • Code will be shared publicly (subject to disclosure constraints)
What Have We Done?

• Version 1 Release – February 14
  • Proof of concept
    • 1 year
    • Mirror income and poverty releases – money income (no taxes, credits, in-kind benefits)
  • Present methods and approach for feedback
• Paper and estimates available at
Measurement Challenges
Survey Data

1. Unit Nonresponse Bias
   • Not answering the survey
   • Poverty biased down by 0.3-0.5 percentage points during the pandemic (Bee and Rothbaum, 2022)

2. Item Nonresponse Bias
   • Not answering income questions (~45 percent of income in the CPS ASEC is imputed!)
   • Poverty biased down by 0.5-1 percentage points (Bollinger et al., 2019; Hokayem et al., 2022)

3. Mis- and underreporting
   • Not answering accurately
   • Poverty biased up by 2.5 percentage points for individuals 65+ (Bee and Mitchell, 2017)

Biases can have different signs and magnitudes which can vary by group
Measurement Challenges
Administrative Data

1. Selection into administrative data
   • Not everyone has to file taxes or gets a W-2 or other information return
   • Larrimore, Mortenson, and Splinter (2020) estimate poverty from administrative data, but must impute the existence and poverty status of 4-6 million people

2. Administrative data “nonresponse”
   • Some information not reported that should have been
   • Under-the-table jobs without a W-2, for example – 5% of adults in CPS ASEC report wage and salary earnings on the survey with no W-2

3. Administrative mis- and underreporting
   • Not always 100% accurate
   • Unreported tips, underreported self-employment earnings (refer to IRS tax gap analyses)
Measurement Challenges

Administrative Data

4. Conceptual misalignment
   • Administrative not always measuring what we want
   • W-2s historically do not have earnings used to pay for health insurance premiums – understate true earnings (Census also doesn’t get this information when it’s available)

5. Incomplete data coverage
   • Data not available for individuals or places

6. Selection into linkage
   • Not all individuals can be linked across data sources (refer to Bond et al., 2014)
## Addressing the Measurement Challenges

Estimation
Combining Survey and Admin Earnings

• Five sources of wage and salary earnings information
  1. Survey
  2. W-2s
  3. Detailed Earnings Records
  4. LEHD
  5. 1040 wage and salary
The Full Picture – Wage and Salary Earnings

1. Use job-level Information to get “best possible” administrative job-level earnings
2. Compare to 1040 to check for missing earnings (at tax-unit level)
3. Compare to survey and decide for which individuals to use adrec or survey earnings
4. Final “best” estimate of earnings for each individual/household

If LEHD is missing (or has apparent data quality issues), impute gross earnings conditional on administrative and survey information for each job (up to 2)

How to combine survey and administrative earnings?
Different Earnings Sources
W-2 vs. Survey Responses

Cluster around 45° line

Survey Earnings Use

• 21 percent of individuals

• More often for:
  • Workers in real estate and construction
  • Younger workers (25-44 year-olds)

• Less often for:
  • Workers in retail, education, management, and health care
  • Older workers (65+)
  • Black workers
Household Income in 2018: NEWS Estimate Relative to Survey

Household Income in 2018: NEWS Relative to Survey by Age

Results

• Overall, median household income was 6.3 percent higher than in the survey estimate, and poverty was 1.1 percentage points lower.

• Results driven by individuals age 65 and over:
  • Median household income was 27.3 percent higher than in the survey estimate
  • Poverty is 3.3 percentage points lower than the survey estimate.

• No significant impact on median household income for householders under 65 or on child poverty.
Future Plans

• More years
  • Not all adrecs are available in all years
  • Not all survey variables are available in all years

• More geographies
  • Use ACS – less detailed information makes combining surveys and adrecs more difficult

• More income/resource concepts
  • Include taxes, credits, and in-kind transfers
  • Supplemental Poverty Measure

• Address more sources of measurement error
  • Self-employment earnings
  • Income at the very top of the distribution (top 0.1%, 0.01%,...)

• Further investigate assumptions, issues for other subgroups of interest
  • Non-citizens, homeless/unhoused (or those with unstable living arrangements), group quarters

• Feedback into surveys to improve questions and processing
