Economic Commission for Europe
Inland Transport Committee
World Forum for Harmonization of Vehicle Regulations
Working Party on Pollution and Energy
Ninetieth session
Geneva, 9–12 January 2024
Item 4 (a) of the provisional agenda
Heavy duty vehicles:
UN Regulations Nos. 49 (Emissions of compression ignition and positive ignition (LPG and CNG engines) and 132 (Retrofit Emissions Control devices (REC))

Proposal for a new Supplement to the 06 series of amendments to UN Regulation No. 49 (Emissions of compression ignition and positive ignition (LPG and CNG engines))

Submitted by the experts from the International Organization of Motor Vehicle Manufacturers *

The text reproduced below was prepared by the experts from the International Organization of Motor Vehicle Manufacturers (OICA). This document aims at permitting the use of hydrogen (H2) as fuel for emissions type approval of heavy duty vehicles. The modifications to the current text of the Regulation are marked in bold for new or strikethrough for deleted characters.

* In accordance with the programme of work of the Inland Transport Committee for 2023 as outlined in proposed programme budget for 2024 (A/78/6 (Sect. 20), table 20.5), the World Forum will develop, harmonize and update UN Regulations in order to enhance the performance of vehicles. The present document is submitted in conformity with that mandate.
I. Proposal

*Insert a new paragraph 3.5.*, to read:

"3.5. Application for type approval of engines fuelled with hydrogen

3.5.1. In case of an application for type approval of engines fuelled with hydrogen, hydrogen shall be the fuel the engine is designed to run primarily. Requirements for dual-fuel hydrogen engines have not yet been established under this regulation."

*Paragraph 4.6.2.*, amend to read:

"4.6.2. If the manufacturer permits the engine family to run on market fuels that do not comply neither with the reference fuels included in Annex 5 nor CEN standard EN 228 (in the case of unleaded petrol) or grade D (type I or II) of ISO standard ISO 14687 (in the case of hydrogen) or CEN standard EN 590 (in the case of diesel), such as running on FAME B100 (CEN standard EN14214), FAME diesel blends B20/B30 (CEN standard EN 16709), paraffinic fuel (CEN standard EN 15940) or others the manufacturer shall, in addition to the requirements in paragraph 4.6.1. comply with the following requirements:"

*Insert a new paragraph 4.12.3.3.8.*, to read:

"4.12.3.3.8. For hydrogen fuelled engines the approval mark shall contain a letter(s) after the national symbol, the purpose of which is to distinguish the fuel type and the working principal for which the approval has been granted. This letter(s) will be as follows:

(a) T in case of a PI engine being approved and calibrated for gaseous hydrogen

(b) TD in case of a CI engine being approved and calibrated for gaseous hydrogen

(c) U in case of a PI engine being approved and calibrated for liquefied hydrogen

(d) UD in case of a CI engine being approved and calibrated for liquefied hydrogen"

*Insert a new paragraph 5.1.6.*, to read:

"5.1.6. Provisions for engines fuelled with hydrogen

5.1.6.1. In case of an application for type approval of engines fuelled with hydrogen, the emission measurement system shall comply with the highest exhaust water content expected during emission testing. In particular it shall be ensured that the temperatures of all sample gas carrying components of the emission measurement system, except for sample dryers, remain at least 10 K above the dew point of the sample gas at the corresponding position."

*Paragraph 5.3.*, amend to read:

"5.3. Emission limits

Table 1 provides the emissions limits that apply to this Regulation."
Table 1

<table>
<thead>
<tr>
<th>Emission Limits</th>
</tr>
</thead>

</tr>
</tbody>
</table>

Notes:
- PI = Positive Ignition
- CI = Compression Ignition
- *) The admissible level of NO\textsubscript{2} component in the NO\textsubscript{x} limit value may be defined at a later stage.
- **) The limit shall apply as from the dates set out in row B of Table 1 in Appendix 9 to Annex 1 to this Regulation.
- ***) For engines where all the fuels used have a molar carbon to hydrogen ratio of 0 as defined in paragraph 8. of Annex 4, the measurement of CH\textsubscript{4} is not required and the manufacturer, technical service or Type Approval Authority may choose to measure the total hydrocarbon (THC) emissions instead of measuring the non-methane hydrocarbon emissions. In that case, the emission limit for the total hydrocarbon emissions is the same as shown in paragraph 5.3. of this Regulation for non-methane hydrocarbon emissions."

Paragraph 8.3.3.3., amend to read:

"8.3.3.3. For diesel, ethanol (ED95), petrol, E85, hydrogen, LNG20, LNG and LPG fuelled, including dual-fuel, engines, all these tests may be conducted with the applicable market fuels. However, at the manufacturer’s request, the reference fuels described in Annex 5 to this Regulation may be used. This implies tests, as described in paragraph 4. of this Regulation.”

Annex 1, paragraph 3.2.2.2., amend to read:

"3.2.2.2. Heavy duty vehicles Diesel/Petrol/LPG/NG-H/NG-L/ NG-HL/Ethanol (ED95)/ Ethanol (E85)/ Hydrogen (T) /Hydrogen (TD) /Hydrogen (U) /Hydrogen (UD) 1)"

Annex 1, paragraph 3.2.17.1., amend to read:

Addendum to Annex 2A, paragraph 1.1.5., amend to read:

"1.1.5. Category of engine: Diesel/Petrol/LPG/NG-H/NG-L/NG-HL/Ethanol (ED95)/ Ethanol (E85)/ LNG/LNG20 /Hydrogen (T) /Hydrogen (TD) /Hydrogen (U) /Hydrogen (UD) 1)"

Addendum to Annex 2A, paragraph 1.4.1., amend to read:

"1.4.1. WHSC test"

Annex 4, paragraph 3.3., amend to read:

"3.3. Symbols and abbreviations for the fuel composition

\[ w_{ALF} \] Hydrogen content of fuel, per cent mass
\[ w_{BET} \] Carbon content of fuel, per cent mass
\[ w_{GAM} \] Sulphur content of fuel, per cent mass
\[ w_{DEL} \] Nitrogen content of fuel, per cent mass
\[ w_{EPS} \] Oxygen content of fuel, per cent mass
\[ \alpha \] Molar hydrogen ratio \( \frac{H}{C} \)
\[ \beta \] Molar carbon ratio
\[ \gamma \] Molar sulphur ratio \( \frac{S}{C} \)
\[ \delta \] Molar nitrogen ratio \( \frac{N}{C} \)
\[ \epsilon \] Molar oxygen ratio \( \frac{O}{C} \)

Referring to a fuel \( C_{\beta}H_{\alpha}O_{\gamma}N_{\delta}S_{\epsilon} \) with \( \beta = 1 \) for fuels containing carbon and \( \beta = 0 \) for fuels with a molar carbon to hydrogen ratio of 0 as defined in paragraph 8. of this annex."

Annex 4, paragraph 3.4., amend to read:

"3.4. Symbols and abbreviations for the chemical components

\[ C_1 \] Carbon 1 equivalent hydrocarbon
\[ CH_4 \] Methane
\[ C_2H_6 \] Ethane
\[ C_3H_8 \] Propane
\[ CO \] Carbon monoxide
\[ CO_2 \] Carbon dioxide
\[ DOP \] Di-octyl phthalate
\[ HC \] Hydrocarbons"
H₂ Hydrogen
H₂O Water
NMHC Non-methane hydrocarbons
NOx Oxides of nitrogen
NO Nitric oxide
NO₂ Nitrogen dioxide
O₂ Oxygen
PM Particulate matter

Annex 4, paragraph 5.2.3.6., amend to read:

"5.2.3.6. Fuel type
(a) Diesel;
(b) Natural gas (NG);
(c) Liquefied petroleum gas (LPG);
(d) Ethanol;
(e) Petrol;
(f) Hydrogen."

Annex 4, paragraph 8., amend to read:

"8. Emission calculation
The final test result shall be rounded in one step to the number of places to the right of the decimal point indicated by the applicable emission standard plus one additional significant figure, in accordance with ASTM E 29-06B. No rounding of intermediate values leading to the final break-specific emission result is permitted.

Calculation of hydrocarbons and/or non-methane hydrocarbons is based on the following molar carbon/hydrogen/oxygen ratios (C/H/O) of the fuel:

CH₁.₈₆O₀.₀₀₆ for diesel (B7),
CH₂.₉₂O₀.₄₆ for ethanol for dedicated C.I. engines (ED95),
CH₁.₉₃O₀.₃₂ for petrol (E10),
CH₂.₇₄O₀.₃₈₅ for ethanol (E85),
CH₂.₅₂₅ for LPG (liquefied petroleum gas),
CH₄ for NG (natural gas) and biomethane,

H₂ for hydrogen.

Examples of the calculation procedures are given in Appendix 5 to this annex.

Emissions calculation on a molar basis, in accordance with Annex 7 of UN GTR① No. 11 concerning the exhaust emission test protocol for Non-Road Mobile Machinery (NRMM), is permitted with the prior agreement of the Type Approval Authority."

Annex 4, paragraph 8.1.1. Equation (15), amend to read:

"  
  \[ k_{w,r} = \left( \frac{1}{1 + \alpha \times 0.005 \times (c_{CO2} + c_{CO})} - k_{w1} \right) \times 1.008 \]  
  \[ k_{w,w} = \left( \frac{1}{1 + \alpha \times 0.005 \times (c_{CO2} + c_{CO})} - k_{w1} \right) \times 1.008 \]  
  "
Annex 4, paragraph 8.1.1., amend to read:

"... Equations 13 and 14 are principally identical with the factor 1.008 in equations 13 and 15 being an approximation for the more accurate denominator in equation 14. Equation 15 is not applicable, if one of the fuels used has a molar carbon to hydrogen ratio of 0 as defined in paragraph 8. of this annex. Equations 13 to 17 are not applicable in the case that water injection is used."

Annex 4, paragraph 8.1.2., amend to read:

"8.1.2. Diluted exhaust gas

\[
k_{w,e} = \left(1 - \alpha \times \frac{c_{CO2w}}{200}\right) - k_{w2} \times 1.008 \quad (18)
\]

or

\[
k_{w,e} = \left(\frac{1 - k_{w2}}{1 + \alpha \times \frac{c_{CO2w}}{200}}\right) \times 1.008 \quad (19)
\]

With

\[
k_{w2} = \frac{1.608 \times [H_d \times (1 - D) + H_a \times (\frac{1}{D})]}{1000 + [1.608 \times H_d \times (1 - D) + H_a \times (\frac{1}{D})]} \quad (20)
\]

Where:

- \(\alpha\) is the molar hydrogen ratio of the fuel
- \(c_{CO2w}\) is the wet CO2 concentration, per cent
- \(c_{CO2d}\) is the dry CO2 concentration, per cent
- \(H_d\) is the diluent humidity, g water per kg dry air
- \(H_a\) is the intake air humidity, g water per kg dry air
- \(D\) is the dilution factor (see paragraph 8.5.2.3.2.)

Equation (18) and (19) are not applicable if one of the fuels used has a molar carbon to hydrogen ratio of 0 as defined in paragraph 8. of this annex."

Annex 4, paragraph 8.1.3. Equation (22), amend to read:

"\[
\frac{k_w}{k_w^3} = \frac{1.608 \times H_d}{1000 + (1.608 \times H_d)}
\]

Annex 4, paragraph 8.4.1.1., amend to read:

"8.4.1.1. Introduction

For calculation of the emissions in the raw exhaust gas and for controlling of a partial flow dilution system, it is necessary to know the exhaust gas mass flow rate. For the determination of the exhaust mass flow rate, one of the methods described in paragraphs 8.4.1.3. to 8.4.1.6. may be used. In the case of the determination of exhaust gas mass flow for hydrogen engines the carbon balance method defined in paragraph 8.4.1.7. shall not be applied."

Annex 4, paragraph 8.4.1.6., amend to read:

"... With

\[
\frac{A/F_{E}}{H_{E}} = \frac{12.091 \times (10.094 \times x + 15.094 \times y + 14.094 \times x + 12.094 \times y)}{12.094 \times (10.094 \times x + 15.094 \times y + 14.094 \times x + 12.094 \times y)}
\]
Table 5
Annex 4, paragraph 8.4.2.3. Table 5, amend to read:

depending on fuel at $\lambda = 2$, dry air, 273 K, 101.3 kPa
accurate within 0.2 % for mass composition of: C=66 - 76 %; H=22 - 25 %; N=0 - 12 %
NMHC on the basis of CH$_{2.93}$ (for total HC the $u_{\text{gas}}$ coefficient of CH$_4$ shall be used)
accurate within 0.2 % for mass composition of: C3 = 70 - 90 %; C4 = 10 - 30 %

Annex 4, paragraph 8.4.2.4., amend to read:

"…

The molar mass of the exhaust, $M_e$, shall be derived for a general fuel composition $C_\beta H_\alpha O_\epsilon N_\delta$ under the assumption of complete combustion, as follows:

\[
M_{e,i} = 1 + q_{mf,i} + q_{maw,i} \times \alpha_4 + \epsilon_2 + \delta_2 12,011 \times 8 + 1,00794 \times x + 15,9994 \times x + 14,0067 \times x + 32,065 \times y \\
= 1 + H_a \times 10^{-3}
\]

Annex 4, paragraph 8.6.3., amend to read:

"8.6.3. Calculation of the specific emissions

The specific emissions $e_{g_{\text{gas}}}$ or $e_{\text{PM}}$ (g/kWh) shall be calculated for each individual component in the following ways depending on the type of test cycle.

For the WHSC, hot WHTC, or cold WHTC, the following equation shall be applied:

\[
e = \frac{m}{W_{\text{act}}}
\]

(69)

\[
e = \frac{(0.14 \times m_{\text{cold}}) + (0.86 \times m_{\text{hot}})}{(0.14 \times W_{\text{act,cold}}) + (0.86 \times W_{\text{act,hot}})}
\]

(70)

Where:

- $m$ is the mass emission of the component, g/test
- $W_{\text{act}}$ is the actual cycle work as determined according to paragraph 7.8.6., kWh

For the WHTC, the final test result shall be a weighted average from cold start test and hot start test according to the following equation:

\[
e = \frac{(0.14 \times m_{\text{cold}}) + (0.86 \times m_{\text{hot}})}{(0.14 \times W_{\text{act,cold}}) + (0.86 \times W_{\text{act,hot}})}
\]

(70)

Where:

- $m_{\text{cold}}$ is the mass emission of the component on the cold start test, g/test
- $m_{\text{hot}}$ is the mass emission of the component on the hot start test, g/test
- $W_{\text{act,cold}}$ is the actual cycle work on the cold start test, kWh
- $W_{\text{act,hot}}$ is the actual cycle work on the hot start test, kWh
If periodic regeneration in accordance with paragraph 6.6.2. applies, the regeneration adjustment factors $k_{r,u}$ or $k_{r,d}$ shall be multiplied with or be added to, respectively, the specific emissions result $e$ as determined in equations 69 and 70."

Annex 4, paragraph 9.3.9.1., amend to read:

"9.3.9.1. CO analyser interference check

Water and CO$_2$ can interfere with the CO analyser performance. Therefore, a CO$_2$ span gas having a concentration of 80 to 100 per cent of full scale of the maximum operating range used during testing shall be bubbled through water at room temperature and the analyser response recorded. The analyser response shall not be more than 2 per cent of the mean CO concentration expected during testing or 20 ppm, whichever is larger.

..."

Annex 4, paragraph 9.4.6.4., amend to read:

"9.4.6.4. Carbon Flow Check

A carbon flow check using actual exhaust is strongly recommended for detecting measurement and control problems and verifying the proper operation of the partial flow system. The carbon flow check should be run at least each time a new engine is installed, or something significant is changed in the test cell configuration.

The engine shall be operated at peak torque load and speed or any other steady state mode that produces 5 per cent or more of CO$_2$. The partial flow sampling system shall be operated with a dilution factor of about 15 to 1.

If a carbon flow check is conducted, the procedure given in Appendix 4 shall be applied. The carbon flow rates shall be calculated according to Equations 112 to 114 in Appendix 4 to this Annex. All carbon flow rates should agree to within 3 per cent.

In the case that a hydrogen fuelled engine is to be tested, the carbon flow check should be performed on a diesel fuelled engine prior to the installation of the hydrogen fuelled engine."

Annex 4, Appendix 7, paragraph A.7.2.1., amend to read:

"A.7.2.1. Laser Diode Spectrometer (LDS) Laser Infrared Analyser

A.7.2.1.1. Measurement principle

The LDS employs the single line spectroscopy principle. The NH$_3$ absorption line is chosen in the near infrared spectral range and scanned by a single-mode diode laser.

Measurement Principles

An infrared laser such as a tunable diode laser (TDL) (e.g. those used in a Laser Diode Spectrometer (LDS), or a quantum cascade laser (QCL) can emit coherent light in the near-infrared region or in the mid-infrared region respectively, where nitrogen compounds including NH$_3$ have strong absorption. These laser optics give a pulsed-mode high resolution narrow band near-infrared or mid-infrared spectrum. Therefore, laser infrared analysers can reduce interference caused by the spectral overlap of co-existing components in engine exhaust gas.

A.7.2.1.2. Installation

The analyser shall be installed either directly in the exhaust pipe (in-situ) or within an analyser cabinet using extractive sampling in accordance with the instrument manufacturers instructions. If installed in an analyser cabinet, the sample path (sampling line, pre-filter(s) and valves) shall be made of stainless steel or PTFE and shall be heated to $463 \pm 10$ K (190 ± 10 °C) between 383
and 464 K (110 – 191 °C) in order to minimize NH₃ losses and sampling artefacts. In addition, the sampling line shall be as short as practicably possible.

Influence from exhaust temperature and pressure, installation environment and vibrations on the measurement shall be minimized, or compensation techniques be used.

If applicable, sheath air used in conjunction with in-situ measurement for protection of the instrument, shall not affect the concentration of any exhaust component measured downstream of the device, or sampling of other exhaust components shall be made upstream of the device.

A.7.2.1.3. Cross interference

The spectral resolution of the laser shall be within 0.5 cm⁻¹ in order to minimize cross interference from other gases present in the exhaust gas."

Annex 4, Appendix 7, paragraph A.7.2.2.2., amend to read:

"A.7.2.2. Installation and sampling

The FTIR shall be installed in accordance with the instrument manufacturer's instructions. The NH₃ wavelength shall be selected for evaluation. The sample path (sampling line, pre-filter(s) and valves) shall be made of stainless steel or PTFE and shall be heated to 463 ± 10 K (190 ± 10 °C) between 383 and 464 K (110 – 191 °C) in order to minimize NH₃ losses and sampling artefacts. In addition, the sampling line shall be as short as practicably possible."

Annex 5, add new fuel type to read:

"10.1.11.11. CO₂ mass window: Minimum and maximum window duration [s] for engines where none of the fuels used has a molar carbon to hydrogen ratio of 0 as defined in paragraph 8. of Annex 4."

Annex 8, paragraph 10.1.11.13., amend to read:

"10.1.11.13. CO₂ mass window: Percentage of valid windows for engines where none of the fuels used has a molar carbon to hydrogen ratio of 0 as defined in paragraph 8. of Annex 4."

Annex 8, paragraph 10.1.12.4., amend to read:

"10.1.12.4. CO₂ analyser zero, span and audit results, pre and post test for engines where one of the fuels used has a molar carbon to hydrogen ratio greater than 0 as defined in paragraph 8. of Annex 4."
Annex 8, Appendix 1, paragraph A.1.1., amend to read:

"A.1.1. Introduction

This Appendix describes the procedure to determine pollutant emissions from on-vehicle on-road measurements using Portable Emissions Measurement Systems (hereinafter “PEMS”). The pollutant emissions to be measured from the exhaust of the engine include the following components: carbon monoxide, total hydrocarbons, nitrogen oxides and PM number for compression ignition engines and carbon monoxide, non-methane hydrocarbons, methane, nitrogen oxides and PM number for positive ignition engines. Additionally, carbon dioxide shall be measured to enable the calculation procedures described in paragraph A.1.4.

For engines fuelled with natural gas, the manufacturer, technical service or Type Approval Authority may choose to measure the total hydrocarbon (THC) emissions only instead of measuring the methane and non-methane hydrocarbon emissions. In that case, the emission limit for the total hydrocarbon emissions is the same as the one shown in paragraph 5.3. of this Regulation for methane emissions. For the purposes of the calculation of the conformity factors pursuant to paragraphs A.1.4.2.3. and A.1.4.3.2., the applicable limit shall in that case be the methane emission limit only.

For engines fuelled with gases other than natural gas, the manufacturer, technical service or Type Approval Authority may choose to measure the total hydrocarbon (THC) emissions instead of measuring the non-methane hydrocarbon emissions. In that case, the emission limit for the total hydrocarbon emissions is the same as shown in paragraph 5.3. of this Regulation for non-methane hydrocarbon emissions. For the purposes of the calculations of the conformity factors pursuant to paragraphs A.1.4.2.3. and A.1.4.3.2., the applicable limit shall in that case be the non-methane emission limit.

For engines where all the fuels used have a molar carbon to hydrogen ratio of 0 as defined in paragraph 8. of Annex 4, the manufacturer may choose to measure only the total hydrocarbon (THC), carbon monoxide (CO), nitrogen oxides (NOx) and PM number. In this case lambda and optionally air mass flow shall be measured as well to enable the data consistency check as described in paragraph A.1.3.2.”

"Annex 12, paragraph 3.1., amend to read:

"3.1. Raw measurement

This paragraph shall apply, if CO\(_2\) is measured in the raw exhaust gas and the molar carbon to hydrogen ratio of all the fuels used is greater than 0 as defined in paragraph 8. of Annex 4."

Annex 12, paragraph 3.2., amend to read:

"3.2. Dilute measurement

This paragraph shall apply, if CO\(_2\) is measured in the dilute exhaust gas and the molar carbon to hydrogen ratio of all the fuels used is greater than 0 as defined in paragraph 8. of Annex 4."

Annex 12, insert new paragraph 3.3., to read:

"3.3. Calculation from fuel consumption

This paragraph shall apply, if the molar carbon to hydrogen ratio of all the fuels used is 0 as defined in paragraph 8. of Annex 4.

The fuel consumption shall be determined according to paragraph 4. of this annex and the measured test-averaged fuel consumption shall be used as the base for calculating the test averaged CO\(_2\) emissions.

The mass of CO\(_2\) (g/test) shall be set to zero according to the following equation:
\[ m_{CO_2} = \frac{\beta \times M_{CO_2}}{\beta \times A_C + \alpha \times A_H} \times q_{mf} \]

Where:
- \( \beta \) is the molar carbon ratio of the fuel, with \( \beta = 1 \) for fuels containing carbon and \( \beta = 0 \) for fuels with a molar carbon to hydrogen ratio of 0 as defined in paragraph 8. of Annex 4
- \( \alpha \) is the molar hydrogen ration of the fuel
- \( q_{mf} \) is the measured test-averaged fuel consumption
- \( A_H \) is the atomic mass of hydrogen (1,0079 g/mol)
- \( A_C \) is the atomic mass of carbon (12,011 g/mol)

"Annex 12, paragraph 3.3. (former), renumber as paragraph 3.4.

II. Justification

1. Hydrogen-fueled vehicles are covered by UN Regulation No. 83 and UN Regulation No. 154 (LDV emission control), and hydrogen-fueled engines are covered by UN Regulation No. 49, Series 07 (HDV emission control). However, hydrogen-fueled engines are not yet covered in UN Regulation No. 49, Series 05 and 06.

2. Hydrogen fuelled engines could be one complementary option to reduce CO\(_2\) emission of future heavy-duty vehicles

3. Hydrogen fuel should be included in the UN Regulation No. 49, Series 05 and 06 similarly to UN Regulation No. 49, Series 07 (HDV emission control)

4. This amendment aims to integrate only mono-fuel hydrogen engines. Further amendments integrating hydrogen dual-fuel engines are expected to follow when their validation can be accomplished.

5. In relation to the proposed amendment to Appendix 7 to Annex 4, the quantum cascade laser infra-red (QCL-IR) measurement principle for NH3 is already existing in GTR-15 (WLTP) and EU Stage V NRMM legislation. It is deemed appropriate to introduce this same measurement principle in UN Regulation No. 49 and allow widening the temperature range of the sample path (110 - 191 °C).
