

UNLOCODE, GitHub and JSON-LD

Advisory Group Meeting 28th June
2022

UNLOCODE

UNLOCODES are an **essential** code list for movement of goods globally, they are used in almost every **EDIFACT, ANSI and API** related to transportation and supply chains. Industry **heavily rely** upon this **important code list**.

The maintenance team are doing an **amazing job** for UNLOCODE, they need to have the tools to continue to deliver what is needed today but more importantly in **future for this code list**.

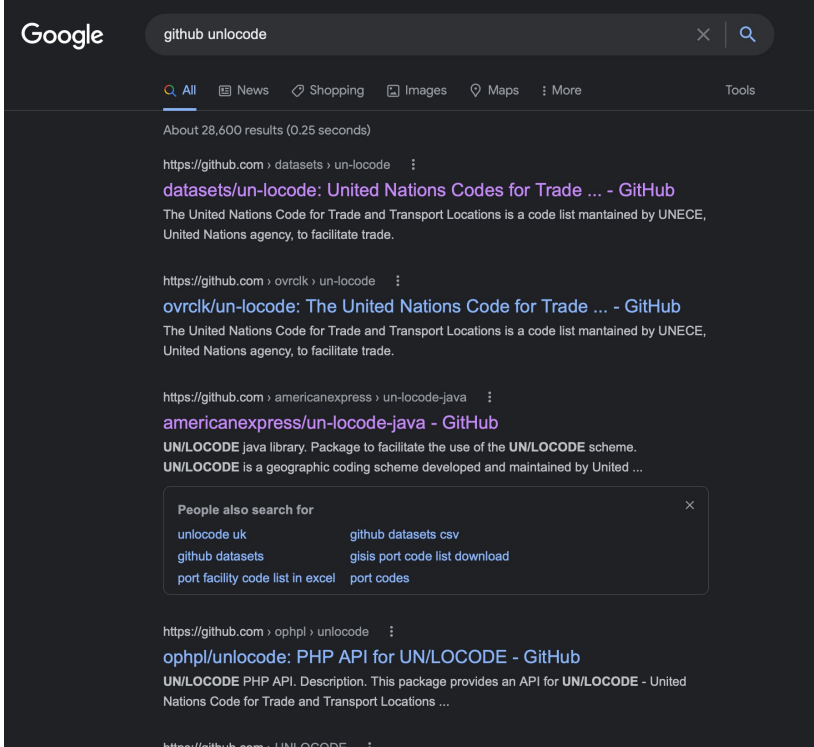

UNLOCODE

- Potential room for improvement to **distribute codes** in between official publication once approved by maintenance team
- **Linked data and API's** require codes to be consumable and **understood by machines rather than humans**
- Latitude and Longitude also needed in **Decimal Degrees** for all locations
- **Notification to interested parties** of code changes and new publication release is not straightforward, hampers updating of codes in systems
- UNLOCODE **publication could be automated** using scripts and process from **open source tools**

UNLOCODE

UNECE should be the recognised ‘**publisher**’ of UNLOCODE to the **software developer community**, they are not today, developers use version control. **GitHub** is the most widely used version control system, our code lists are not published. **We don’t make it as easy** as it should be for our ‘customers’.

Nobody reads the UNLOCODE list it needs to be **consumed by software** to be useful

The image shows a Google search interface with the query "github unlocode". The search results are displayed in a dark theme. The top result is "datasets/un-locode: United Nations Codes for Trade ... - GitHub", with a description: "The United Nations Code for Trade and Transport Locations is a code list maintained by UNECE, United Nations agency, to facilitate trade." Below this is another result: "ovrclk/un-locode: The United Nations Code for Trade ... - GitHub", with a similar description. The third result is "americanexpress/un-locode-java - GitHub", described as a "UN/LOCODE java library. Package to facilitate the use of the UN/LOCODE scheme. UN/LOCODE is a geographic coding scheme developed and maintained by United ...". A "People also search for" box is visible, containing suggestions like "unlocode uk", "github datasets csv", "gis port code list download", "port facility code list in excel", and "port codes". The bottom result is "ophpl/unlocode: PHP API for UN/LOCODE - GitHub", described as a "UN/LOCODE PHP API. Description. This package provides an API for UN/LOCODE - United Nations Code for Trade and Transport Locations ...".

What is GitHub?

- Version control for code or data
- Can **'tag'** releases so they are preserved and can be official publications like UN/CEFACT do i.e. **'D21b'**
- Use branches for developing and daily work on the next 'release' in public or private
- Allows 'issues' or 'pull requests' to be made by external contributors for consideration, but **control remains with the repository owner**
- Can assign changes to **'reviewers'**
- Allows viewing of the **'changes'** made in that release or a 'diff'

GitHub Features

GitHub Actions

Scripted actions that take place on a commit to the dataset

- Allow **pre-defined repeatable tasks to be automated**, i.e.
 - **Pre-validation**, reject request if not complete or correct (i.e. code, function)
 - **Potentially provide Decimal Degree co-ordinates** for a UNLOCODE from a gazetteer API
 - **Publication** of the excel, mdb, json-ld or other formats and update UNECE website
- Run from commit to the 'main' branch or a 'tag/release'
- Could **update the UNECE website** for example

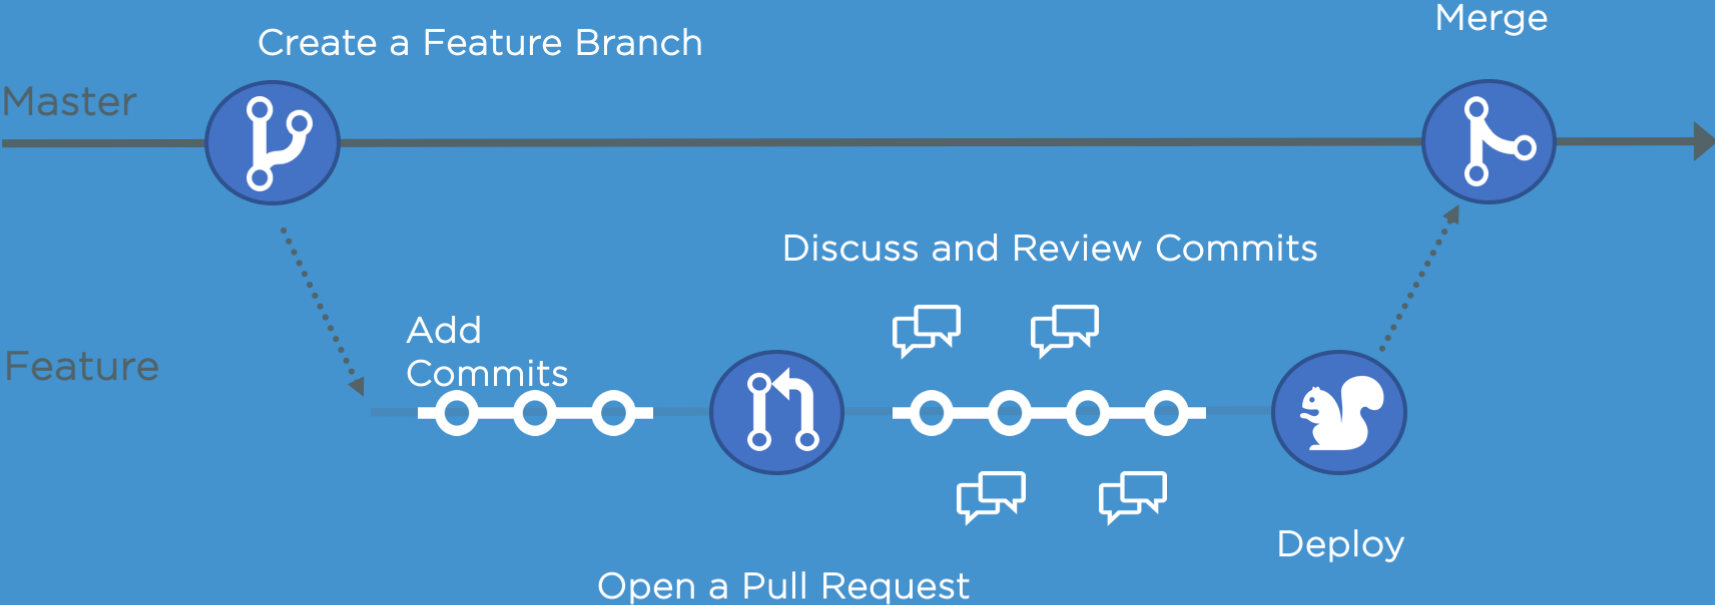

GitHub Features

Webhooks

Immediately deliver dataset to other applications or parties on release

- Example of UN/CEFACT Recommendation code lists to be published and **automatically notify and update related external parties**
 - UN/LOCODE update could be sent automatically to child code providers such as BIC, IMO and SMDG who can then automate the updates and programmatically check for deprecated UN/LOCODES for example.
 - DCSA and Ocean Carriers can include the UNLOCODES as valid inputs for API requests from the UN directly
 - IPCSA and the Port Communities rely upon the UNLOCODE to service movement of goods and could use the UN as the official data source for UNLOCODES

Linked Data – JSON-LD

[Linked Data](#) empowers people that publish and use information on the Web. It is a way to create a network of standards-based, machine-readable data across Web sites. It allows an application to start at one piece of Linked Data, and follow embedded links to other pieces of Linked Data that are hosted on different sites across the Web.

Questions?

If you have questions or comments on the presentation today or would like to explore further how to use GitHub for UNLOCODES please contact me
