

## ICP Vegetation update

*Felicity Hayes, Katrina Sharps and Mike Perring*  
*ICP Vegetation Coordination Centre\*, UKCEH*

*\* Financial support provided by Defra (UK) and UNECE*

# Task Force Meeting 2024

In person: 19-22 February 2024. Hosted by Lithuanian Research Centre for Agriculture and Forestry.  
62 registered participants

Next meeting will be In Person (hopefully!), February 2025 in Albania

# ICP Vegetation

## Overview

Current major topics:

Ozone impacts (global), in current and future scenarios

Nitrogen (impacts on vegetation and deposition to mosses)

Metal deposition (mosses as biomonitors) – Europe+

## Participation

63 countries/territories currently contributing

Albania	Czechia	Iceland	Moldova	Spain
Algeria	Denmark	India	Mongolia	Sweden
Argentina	Egypt	Indonesia	Montenegro	Switzerland
Armenia	Estonia	Ireland	Norway	Tanzania
Austria	Faroe Islands	Italy	Pakistan	Thailand
Azerbaijan	Finland	Japan	Poland	Turkey
Belarus	France	Kazakhstan	Romania	Uganda
Belgium	North Macedonia	Kenya	Russian Fed.	Ukraine
Bulgaria	Georgia	Kosovo*	Rwanda	UK
Cambodia	Germany	Latvia	Serbia	USA
Canada	Greece	Lithuania	Slovakia	Vietnam
China	Hong Kong	Malawi	Slovenia	
Croatia	Hungary	Malaysia	South Africa	

# Mapping Manual - Annexes

**Soil Moisture Index:** Led by CIEMAT (Spain). This documents the way in which soil water is used in the ozone deposition and flux calculations of the EMEP MSC-W chemical transport model (Simpson et al., 2007, 2012). Presents some problems associated with the availability of robust soil water data, and then the solution adopted for EMEP – the soil moisture index (SMI).

Similar ‘supporting documents’ to be prepared to support the moss survey – explaining reasoning for decisions and additional information

# DO<sub>3</sub>SE Model – will include grain protein

In wheat:

Ozone accelerates senescence

Ozone reduces remobilisation of N within the plant

Grainfill is reduced

% Grain protein is increased, but protein yield is reduced

We know global wheat yield is reduced by ozone

What is the impact on dietary protein?

N module has been developed for DO<sub>3</sub>SE to investigate this

# Signalling using VOCs

The signal emitted by flowers is altered by ozone – altered bVOC quality and quantity. Examples from crops and native (grassland) species

The floral signal is degraded by ozone (and NO<sub>x</sub>)

More difficult to locate flowers, especially from a distance, which increases foraging times

Foraging time is significantly increased with ozone concentrations of 60 ppb (Fuentes et al., 2016)

# Floral BVOCs

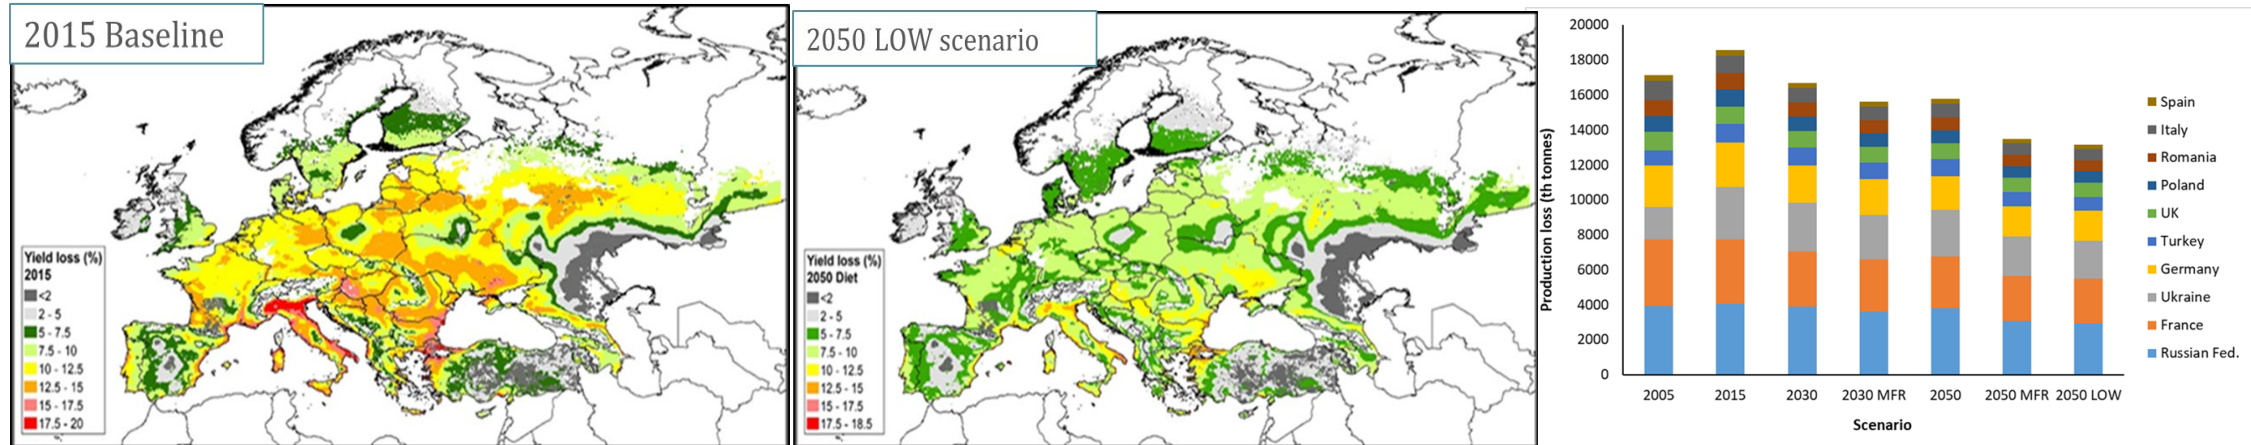

At 'high' (80 ppb) concentrations some BVOCs were no longer emitted (aldehydes and carboxylic acids)

Additional BVOCs were emitted (sesquiterpenes)

The overall 'signature' was dramatically changed

# Review of the effectiveness of the Gothenburg Protocol

‘Ready to go’ with additional possibilities for:

**Wheat production loss** (% and Tonnes) due to ozone, using the  $POD_3IAM$  metric.

**Deciduous forest biomass increment** (related to biodiversity risk?)

More limited coverage for **grassland biodiversity**

# Outreach – leaflets, youtube, webinars, online course

**UKCEH SUNRISE**

## OZONE AND TROPICAL AGRICULTURE

**Now Available!!!!**

For more information, and to register, please go to:  
<https://www.ceh.ac.uk/training/ozone-and-tropical-agriculture>

**A primer for crop scientists, farmers, students and other agricultural stakeholders**

Ensuring a stable food supply is critical for human wellbeing. When producing food, crops are exposed to numerous threats such as pests and diseases, heat stress and drought. All of these can reduce crop yield and be economically costly to manage. Ground level ozone pollution is another, often overlooked, costly threat to agricultural production.

**Course Objectives:**

- Have a basic understanding of ozone and how it is formed
- Understand current and future patterns in ground level ozone
- Understand how ground level ozone is a threat to crop plants
- Learn how to tell when ozone damage has happened
- Learn how to compare visible ozone damage symptoms with other threats to crop production
- Learn about possible management options - mitigation and adaptation

In the coming years, this gas will increase in concentration with damaging effects on plants including reduced crop yield and quality. The increase in ozone concentrations is happening all over the planet. Scientists expect the effects to concentrate in important tropical and sub-tropical crop-producing areas e.g. sub-Saharan Africa and parts of Asia.

The course is delivered by Dr. Felicity Hayes, Josie Foster, and Dr. Mike Perring from UKCEH (UK Centre for Ecology & Hydrology) ([www.ceh.ac.uk/](http://www.ceh.ac.uk/)). In preparing this course, UKCEH collaborated with CABI (Centre for Agriculture and Bioscience International) (<https://www.cabi.org/>). If you have any questions, please contact [ozoneandtropicalagriculture@ceh.ac.uk](mailto:ozoneandtropicalagriculture@ceh.ac.uk) or Dr. Mike Perring ([mapper@ceh.ac.uk](mailto:mapper@ceh.ac.uk)).

- Online course

<https://www.ceh.ac.uk/training/ozone-and-tropical-agriculture>

- Youtube ozone overview

<https://youtu.be/OBEJB-60jQU>

- Webinar on ozone and tropical agriculture. Q&A on ICP Vegetation website

- Leaflets/brochure on ozone impacts on vegetation

- Information for Plantwise Knowledgebank on ozone injury symptoms

**Moss survey outreach (to be considered going forwards)**

# Moss survey

# Microplastic Atmospheric Deposition Assessment using Moss in Europe (MADAME)

*Felicity Hayes, Julian Aherne, Stefano Loppi, Carmen Wolf, Mehriban Jafarova, Jochen Tuerk, Mike Wenzel, Richard Cross  
And participants of the ICP Vegetation*

>29 countries participating

Sample preparation complete  
Sample analysis underway

# MADAME – a few early results

Airborne microplastics are found throughout the UNECE region, even in rural areas such as Scandinavia and western Ireland.

Mosses can be used as a biomonitor for microplastics, but does cause some analytical challenges. Moss is difficult to chemically digest in large quantities.

MADAME has found a wide range of microplastics in moss samples:

- textiles

- plastic litter

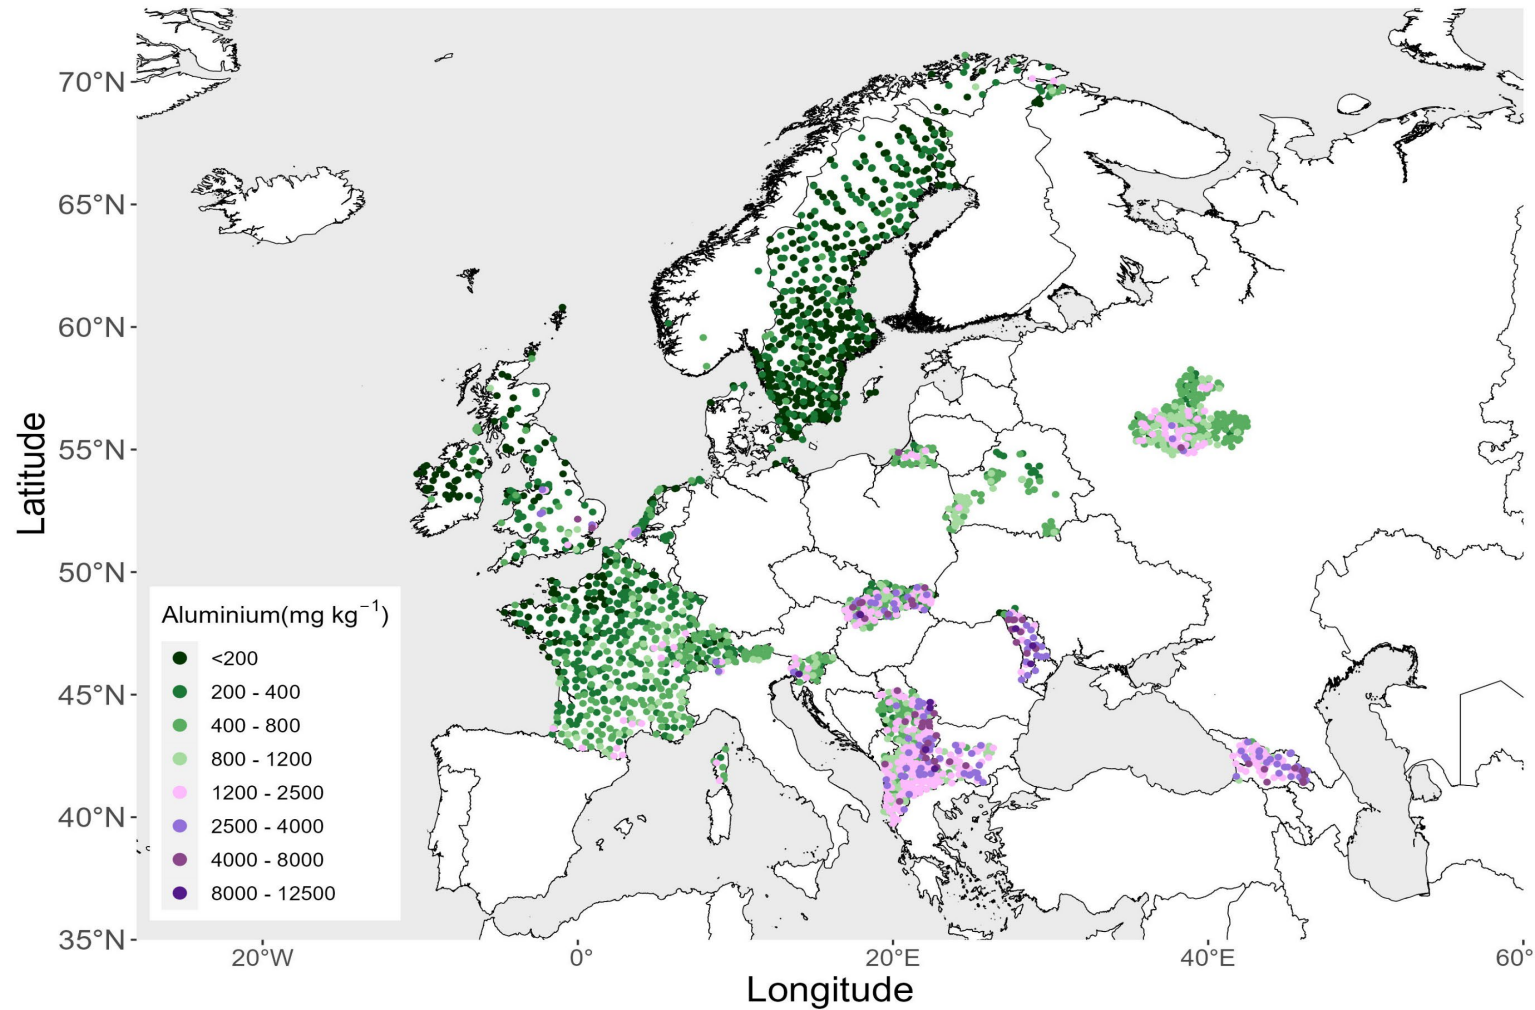

- foams

- polyurethane

- cellulose acetate

- polyethylene

Questions remaining about sources, retention time in moss, whether internal or external, impacts

New 'colour blind friendly' colour scheme to be used on maps relating to the 2020 survey

Maps using the original colouring will be presented in an annex to allow easy comparison to previous surveys

# ICP Vegetation Workplan (2024/2025)

Number	Item	Notes
1.1.1.13	Call for data for moss survey 2025-2026	
1.1.1.13	Report on results from 2020– 2021/22 moss survey on HM, N and POPs	In progress
1.1.1.13	Report of survey of microplastic content of mosses (2022/2023) and potential for use of mosses as bioindicators of airborne microplastics	
1.1.1.14	Develop state of knowledge report: Impacts of O3 on C sequestration in Europe	With ICP Forests
1.1.1.15	Review critical levels for NOx	In progress
	<i>Additional work relating to the Review of the Gothenburg Protocol, and impact to vegetation from the methane contribution to ozone formation</i>	

A photograph of a man in a light blue shirt and glasses, wearing a watch, working with scientific equipment in a greenhouse. The greenhouse has a complex metal frame and is filled with green plants. The image is overlaid with a semi-transparent blue filter.

**Thank you**
