

Emission reporting under the UNECE Convention on Long-Range Transboundary Air Pollution

Ketevan Kordzakhia, UNECE secretariat

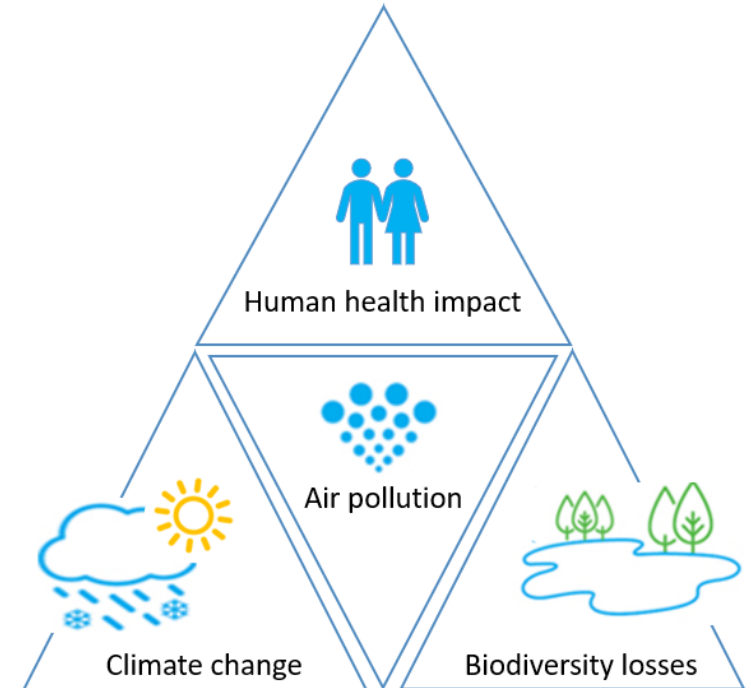

- Key facts and actions to reduce air pollution
- Achievements under Air Convention
- Emission reporting obligations
- eLearning course

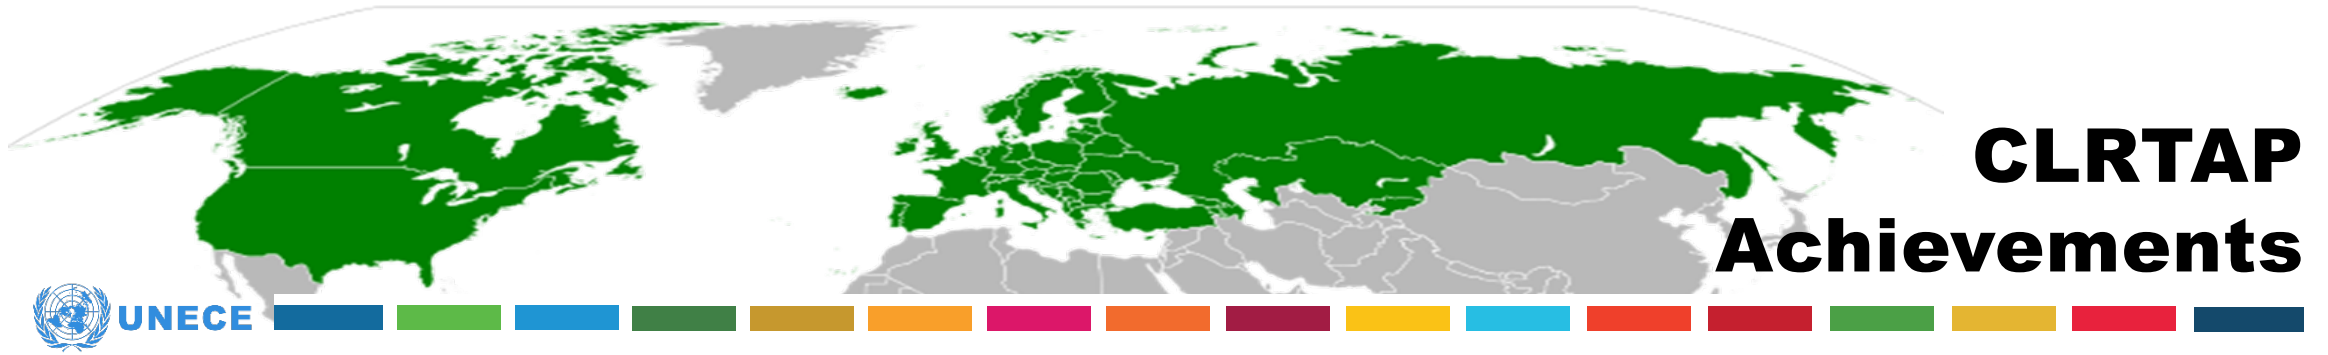

UNECE

Key facts

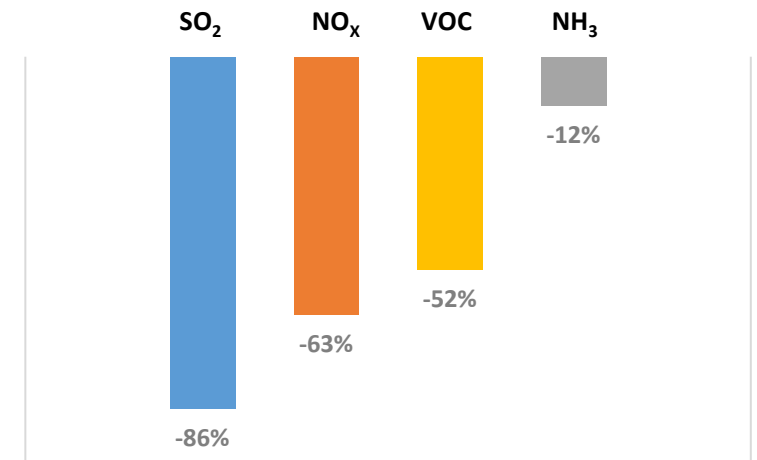

- ❑ 7 million premature deaths globally every year
- ❑ Air pollution is at intersection of the triple planetary crisis
- ❑ Action to reduce air pollution have been globally recognized:
 - ✓ [UNEA 3/8 resolution](#) on preventing and reducing air pollution to improve air quality globally
 - ✓ [UN General Assembly resolution \(A/76/L.75\)](#) on human right to a clean, healthy and sustainable environment
 - ✓ Climate and Clean Air Coalition (CCAC) [Clean Air Flagship](#)
- ❑ Several regional cooperation agreements and networks

- Signed in 1979, entry into force in 1983
- First international treaty to deal with air pollution on a broad regional basis
- 51 Parties in the UNECE region
- Setting emission reduction targets through its protocols
- Science-policy interface: monitoring, modeling and effect-oriented programmes
- Monitoring compliance of Parties
- Capacity-building and awareness-raising

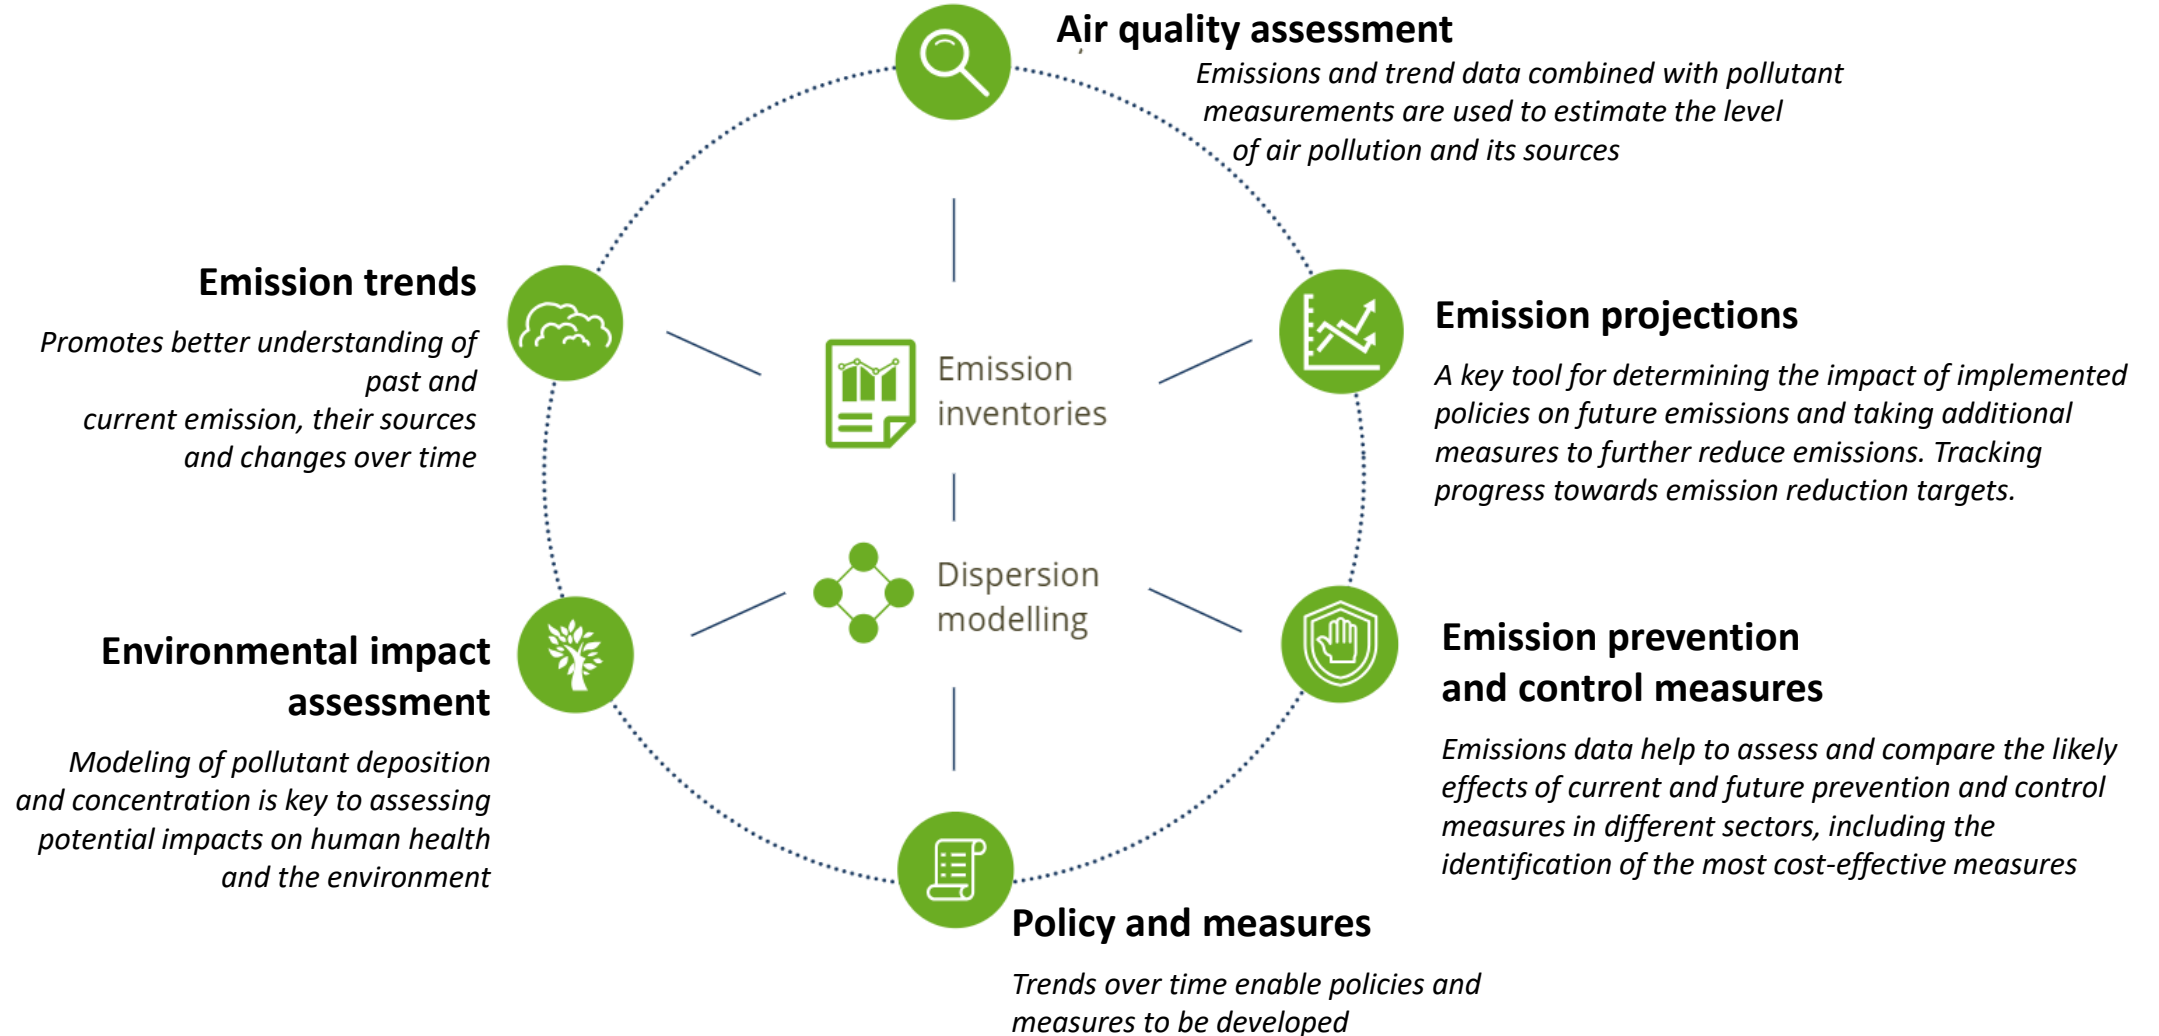

EMISSIONS REDUCTION IN ECE REGION (1990-2021)

UNECE

Emission inventory's role in AQM

Emission reporting, templates and periods

	Report	Deadline	Description	Annex
Annual reporting	Nomenclature for Reporting (NFR)	15 Feb	National totals, NFR sector emissions and activity data	Annex I
	Informative Inventory Report (IIR)	15 March	Description of the data sources and methodologies applied	Annex II
	Notification form	15 Feb	To inform the UNECE Secretariat of the contents of the data submission	Annex III
Four-yearly reporting	Gridded Nomenclature for Reporting (GNFR)	from 2017 by 1 May	Gridded aggregated NFR sector emissions data	Annex V
	Large Point Sources (LPS)	from 2017 by 1 May	Large point sources data for each relevant aggregated NFR sector	Annex VI
	Projections	from 2015 by 15 March	Projected national sectoral, total emissions and activity parameters	Annex IV

E-learning course on how to report emissions under the Air Convention

 Self-paced course

 1.5 hours

 [English](#) and [Russian](#)

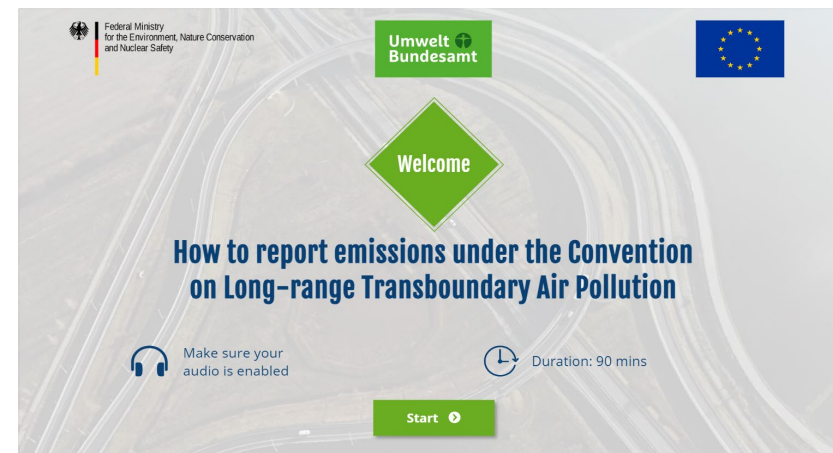

Module 1: Purpose and scope of emission inventories

Module 2: Reporting process and templates

Module 3: Emission estimation methods

Aim of the course

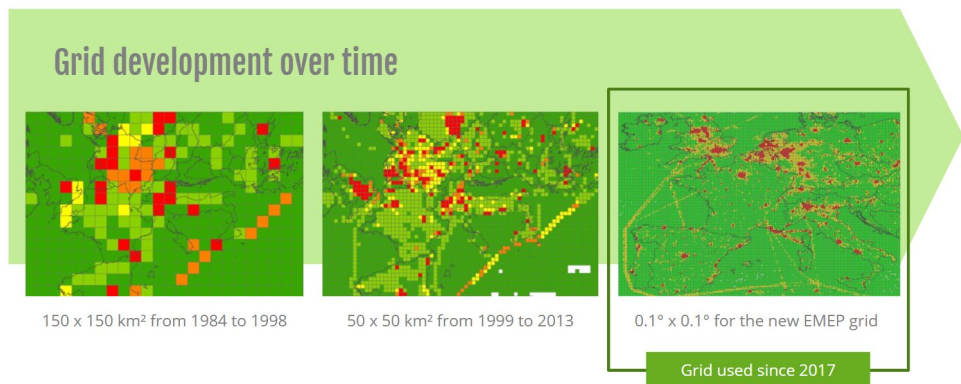

- Assist countries in addressing air pollution and develop emission inventories
- Explain the importance of emission inventories for clean air policy development
- Explain the reporting process and requirements
- Explain methods for emission estimation

Spatial emission mapping and GNFR

Module 2: lesson 2.6 and 2.7

Module 3: lesson 3.6

SPATIAL EMISSION MAPPING

- Use of GIS software
- Management of spatial proxies
- Good understanding of air pollutant sources
- Selection of relevant geographic datasets
- Need for quality and accuracy checks
- Mastery of a specific vocabulary

Access GIS files consistent with grid definition for each Party to the Convention

Click on each source type to learn more.

ANNEX V: Template file for gridded sector data for each of the relevant aggregated Gridding NFR sectors (GNFR)

NFR 2014-4

COUNTRY: (as ISO2 code) Add a new year

DATE: (as DD.MM.YYYY)

YEAR: (as YYYY, year of emissions data)

Version: (as v1.0 for the initial submission)

Description of table columns:

- 1) Longitude and Latitude indicate the centre of the 0.1° x 0.1° grid cell.
- 2) GNFR aggregated sectors must be named A_PublicPower, B_Industry, C_OtherStationaryComb, D_Fugitive, E_Solvents, F_RoadTransport, G_Shipping, H_Aviation, I_Offroad, J_Water, K_Natural, O_AirCruise, P_Installations, M_Mine

VARIABLES	Longitude	Latitude	GNFR aggregated sectors	NOx (as NO _x)	NMVOCS	SO _x (as SO ₂)	NH ₃	PM ₁₀	PM _{2.5}	BC	CO	Pb
UNIT				kt	kt	kt	kt	kt	kt	kt	kt	t

Obligations for all Parties to the Convention:
Update and report GNFR data every 4 years from 2017 onward.

Download the GNFR template

POINT SOURCES

(e.g. industrial plants, power stations)

A point source is an emission source at a location that indicates the main point of emission.

Point sources can be allocated directly to coordinates used to georeference the grid.

LINE SOURCES

(e.g. road, railway, pipeline, shipping lane)

A line source is an emission source that exhibits a line type of geography. They are represented by vectors with a starting node and an end node specifying an x,y location for each. Line source features can also contain vertices that define curves between points.

Intersecting the line features with the grid will produce a dataset of polygons contained within each grid cell. The fraction of the original line length of the line within each grid. The fraction of the original line length of the line to the emissions/proxy statistics from the original line to the grid cell. An emission rate/area can be applied to the new line length and the to the grid cell.

AREA SOURCES

(e.g. forests, residential areas, administrative/commercial activities within urban areas)

An area source is an emission source that exhibits diffuse characteristics. For example, sources that are too numerous or small to be individually identified as point sources or from which emissions arise over a large area.

Intersecting the polygon with the grid produces a dataset of polygons contained within each grid cell. The fraction of the area of the new polygons can be used to distribute the emissions/proxy statistics from the original polygon to the grid cells. Alternatively, an emission rate/area can be applied to the new polygon area and that emission/proxy statistic assigned to the grid cell.

The UNECE Convention on Long-Range Transboundary Air Pollution is a ...

Global
Convention

Regional
agreement

Bilateral
agreement

True or false? Emission inventories are key in developing clean air policies at national and international levels

True

False

Gridded emissions&large point sources data for each relevant aggregated NFR sector, projected emissions&activity data shall be submitted every 4years

True

False

Thank you!
