

Case study for Road Map on Statistics for SDGs 2.0
Russian Federation: National set of SDG indicators

Description	<p>The draft set of national SDG indicators was developed in accordance with the UN General Assembly resolution on the development of national sets of SDG indicators, based on national priorities, local conditions and available statistical capacity.</p> <p>The national set of SDG indicators is designed to monitor the achievement of sustainable development goals at the national level. It reflects national characteristics and takes into account strategic documents of the Government of the Russian Federation, as well as national and federal projects.</p> <p>The national set of SDG indicators is used in the preparation of the VNR and other national reports and publications on the achievement of the sustainable development goals in the Russian Federation.</p>
Advantages	<p>The national set of SDG indicators is a useful tool for tracking the progress made by each region of Russia in achieving the sustainable development goals.</p> <p>Statistical information on SDG indicators, included into the national set and disaggregated by regions of Russia, forms the basis for the statistical handbook “Sustainable development goals in the Russian Federation”, annually published by Rosstat, regional reports on SDGs and expert-analytical activities of the Accounts Chamber of the Russian Federation dedicated to the SDGs achievement in Russia.</p>
Challenges	<p>Due to the use of sample survey data, disaggregation by regions for some indicators remains a challenge.</p>
Future steps	<p>Since the national set of SDG indicators is supposed to be flexible, work on its updating and expanding will continue, including by increasing the number of indicators with regional disaggregation.</p>
